Note:

Shipment index numbers are calculated by multiplying the index number from the same month last year by the year-on-year growth rate reported by the current sample of companies in the survey. Bookings index numbers are calculated by multiplying the current month's shipment index number by the one-month book-to-bill ratio for the current month. This makes these index numbers consistent with the book-to-bill ratios, but the bookings index numbers will not necessarily be consistent with the year-on-year growth rates for bookings. Index numbers are intended to show trends in volume over the long term and are not used to calculate any of the growth rates reported in the monthly news release. These are calculated from the actual survey data. The index was created for internal use by IPC, but is shared with financial analysts at their request.
