     1.5.10 Wire Diameter
     1.5.11 Wire Overwrap
     1.5.12 Wire Overlap

1.6 Examples and Illustrations

1.7 Inspection Methodology

1.8 Verification of Dimensions

1.9 Magnification Aids

1.10 Lighting
If a conflict occurs between the English and translated versions of this document, the English version will take precedence.

1.1 Scope
This standard is a collection of visual quality acceptability requirements for electronic assemblies.

This document presents acceptance requirements for the manufacture of electrical and electronic assemblies. Historically, electronic assembly standards contained a more comprehensive tutorial addressing principles and techniques. For a more complete understanding of this document's recommendations and requirements, one may use this document in conjunction with IPC-HDBK-001, IPC-AJ-820 and IPC J-STD-001.

The criteria in this standard are not intended to define processes to accomplish assembly operations nor is it intended to authorize repair/modification or change of the customer's product. For instance, the presence of criteria for adhesive bonding of components does not imply/authorize/require the use of adhesive bonding, the depiction of a lead wrapped clockwise around a terminal does not imply/authorize/require that all leads/wires be wrapped in the clockwise direction.

Users of this standard should be knowledgeable of the applicable requirements of the document and how to apply them. Objective evidence of the demonstration of this knowledge should be maintained. Where objective evidence is unavailable, the organization should consider periodic review of personnel skills to determine visual acceptance criteria appropriately.

IPC-A-610 has criteria outside the scope of IPC J-STD-001 defining handling, mechanical and other workmanship requirements. Table 1-1 is a summary of related documents.

IPC-AJ-820 is a supporting document that provides information regarding the intent of this specification content and explains or amplifies the technical rationale for transition of limits through Target to Defect condition criteria. In addition, supporting information is provided to give a broader understanding of the process considerations that are related to performance but not commonly distinguishable through visual assessment methods.

The explanations provided in IPC-AJ-820 should be useful in determining disposition of conditions identified as Defect, processes associated with Process Indicators, as well as answering questions regarding clarification in use and application for defined content of this specification. Contractual reference to IPC-A-610 does not additionally impose the content of IPC-AJ-820 unless specifically referenced in contractual documentation.

1.2 Purpose
The visual standards in this document reflect the requirements of existing IPC and other applicable specifications. In order for the user to apply and use the content of this document, the assembly/product should comply with other existing IPC requirements, such as IPC-7351, IPC-2220 (Series), IPC-6010 (Series) and IPC-A-600. If the assembly does not comply with these or with equivalent requirements, the acceptance criteria shall be defined between the customer and supplier.

The illustrations in this document portray specific points noted in the title of each page. A brief description follows each illustration. It is not the intent of this document to exclude any acceptable procedure for component placement or for applying flux and solder used to make the electrical connection; however, the methods used shall produce completed solder connections conforming to the acceptability requirements described in this document.

In the case of a discrepancy, the description or written criteria always takes precedence over the illustrations.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used. Clause number changes as a result of reorganizing within this chapter are not shown.

1.3 Classification

Accept and/or reject decisions shall be based on applicable documentation such as contracts, drawings, specifications, standards and reference documents. Criteria defined in this document reflect three classes, which are as follows:

Class 1 -- General Electronic Products
Includes products suitable for applications where the major requirement is function of the completed assembly.

Class 2 -- Dedicated Service Electronic Products
Includes products where continued performance and extended life is required, and for which uninterrupted service is desired but not critical. Typically the end-use environment would not cause failures.

Class 3 -- High Performance Electronic Products
Includes products where continued high performance or performance-on-demand is critical, equipment downtime cannot be tolerated, end-use environment may be uncommonly harsh, and the equipment must function when required, such as life support or other critical systems.

The customer (user) has the ultimate responsibility for identifying the class to which the assembly is evaluated. If the user and manufacturer do not establish and document the acceptance class, the manufacturer may do so.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used. Clause number changes as a result of reorganizing within this chapter are not shown.

1.4 Definition of Requirements

This document provides acceptance criteria for completed electronic assemblies. Where a requirement is presented that cannot be defined by the acceptable, process indicator, and defect conditions, the word "shall" is used to identify the requirement. The word "shall" in this document invokes a requirement for manufacturers of all classes or product, and failure to comply with the requirement is a noncompliance to this standard.

All products shall meet the requirements of the assembly drawing(s)/documentation and the requirements for the applicable product class specified herein. Missing hardware or components are a Defect for all classes.

1.4.1 Acceptance Criteria

When IPC-A-610 is cited or required by contract as a stand-alone document for inspection and/or acceptance, the requirements of IPC J-STD-001 "Requirements for Soldered Electrical and Electronic Assemblies" do not apply unless separately and specifically required.

When this standard is contractually required, the applicable requirements of this standard (including product Class –see 1.4.1) shall be imposed on all applicable subcontracts.

In the event of conflict, the following order of precedence applies:

1. Procurement as agreed and documented between customer and supplier.
2. Master drawing or master assembly drawing reflecting the customer’s detailed requirements.
3. When invoked by the customer or per contractual agreement, IPC-A-610.

When documents other than IPC-A-610 are cited, the order of precedence shall be defined in the procurement documents.

Criteria are given for each class in four levels of acceptance: Target Condition, Acceptable Condition, and either Defect Condition or Process Indicator Condition.

1.4.1.1 Target Condition

A condition that is close to perfect/preferred, however, it is a desirable condition and not always achievable and may not be necessary to ensure reliability of the assembly in its service environment.

1.4.1.2 Acceptable Condition

This characteristic indicates a condition that, while not necessarily perfect, will maintain the integrity and reliability of the assembly in its service environment.

1.4.1.3 Defect Condition

A defect is a condition that may be insufficient to ensure the form, fit or function of the assembly in its end use environment. Defect conditions shall be dispositioned by the manufacturer based on design, service, and customer requirements. Disposition may be to rework, repair, scrap, or use as is. Repair or "use as is" may require customer concurrence.

A defect for Class 1 automatically implies a defect for Class 2 and 3. A defect for Class 2 implies a defect for Class 3.

1.4.1.3.1 Disposition

The determination of how defects should be treated. Dispositions include, but are not limited to, rework, use as is, scrap or repair.

1.4.1.4 Process Indicator Condition

A process indicator is a condition (not a defect) that identifies a characteristic that does not affect the form, fit or function of a product.

• Such condition is a result of material, design and/or operator/machine related causes that create a condition that neither fully meets the acceptance criteria nor is a defect.
• Process indicators should be monitored as part of the process control system. When the number of process indicators indicate abnormal variation in the process or identify an undesirable trend, then the process should be analyzed. This may result in action to reduce the variation and improve yields.
• Disposition of individual process indicators is not required.
1.4.1.4.1 Process Indicator Methodologies
Process control methodologies should be used in the planning, implementation and evaluation of the manufacturing processes used to produce soldered electrical and electronic assemblies. The philosophy, implementation strategies, tools and techniques may be applied in different sequences depending on the specific company, operation, or variable under consideration to relate process control and capability to end product requirements. The manufacturer needs to maintain objective evidence of a current process control/continuous improvement plan that is available for review.

1.4.1.5 Combined Conditions
Cumulative conditions shall be considered in addition to the individual characteristics for product acceptability even though they are not individually considered defective. The significant number of combinations that could occur does not allow full definition in the content and scope of this specification but manufacturers should be vigilant for the possibility of combined and cumulative conditions and their impact upon product performance.

Conditions of acceptability provided in this specification are individually defined and created with separate consideration for their impact upon reliable operation for the defined production classification. Where related conditions can be combined, the cumulative performance impact for the product may be significant; e.g., minimum solder fillet quantity when combined with maximum side overhang and minimum end overlap may cause a significant degradation of the mechanical attachment integrity. The manufacturer is responsible for identification of such conditions.

1.4.1.6 Conditions Not Specified
Conditions that are not specified as defective or as a process indicator may be considered acceptable unless it can be established that the condition affects user defined form, fit or function.

1.4.1.7 Specialized Designs
IPC-A-610, as an industry consensus document, cannot address all of the possible components and product design combinations. Where uncommon or specialized technologies are used, it may be necessary to develop unique acceptance criteria. However, where similar characteristics exist, this document may provide guidance for product acceptance criteria. Often, unique definition is necessary to consider the specialized characteristics while considering product performance criteria. The development should include customer involvement or consent. For Class 3 the criteria shall include agreed definition of product acceptance.

Whenever possible these criteria should be submitted to the IPC Technical Committee to be considered for inclusion in upcoming revisions of this standard.

1.5 Terms & Definitions
Items noted with an * are quoted from IPC-T-50.

1.5.1 Board Orientation
The following terms are used throughout this document to determine the board side. The source/destination side shall be considered when applying some criteria, such as that in Tables 7-4, 7-5 and 7-7.

1.5.1.1 *Primary Side
That side of a packaging and interconnecting structure (PCB) that is so defined on the master drawing. (It is usually the side that contains the most complex or the most number of components. This side is sometimes referred to as the component side or solder destination side in through-hole mounting technology.)

1.5.1.2 *Secondary Side
That side of a packaging and interconnecting structure (PCB) that is opposite the primary side. (This side is sometimes referred to as the solder side or solder source side in through-hole mounting technology.)

1.5.1.3 Solder Source Side
The solder source side is that side of the PCB to which solder is applied. The solder source side is normally the secondary side of the PCB when wave, dip, or drag soldering are used. The solder source side may be the primary side of the PCB when hand soldering operations are conducted. The source/destination side must be considered when applying some criteria, such as that in Tables 7-3, 7-6 and 7-7.
1.5.1.4 Solder Destination Side
The solder destination side is that side of the PCB that the solder flows toward in a through-hole application. The destination is normally the primary side of the PCB when wave, dip or drag soldering is used. The destination side may be the secondary side of the PCB when hand-soldering operations are conducted. The source/destination side must be considered when applying some criteria, such as that in Tables 7-3, 7-6 and 7-7.

1.5.2 Cold Solder Connection
A solder connection that exhibits poor wetting and that is characterized by a grayish porous appearance. (This is due to excessive impurities in the solder, inadequate cleaning prior to soldering, and/or the insufficient application of heat during the soldering process.)

1.5.3 Electrical Clearance
Throughout this document the minimum spacing between non-common uninsulated conductors (e.g., patterns, materials, hardware, or residue) is referred to as “minimum electrical clearance.” It is defined in the applicable design standard or on the approved or controlled documentation. Insulating material needs to provide sufficient electrical isolation. In the absence of a known design standard use Appendix A (derived from IPC-2221). Any violation of minimum electrical clearance is a defect condition for all classes.

1.5.4 High Voltage
The term “high voltage” will vary by design and application. The high voltage criteria in this document are only applicable when specifically required in the drawings/procurement documentation.

1.5.5 Intrusive Solder
A process in which the solder paste for the through-hole components is applied using a stencil or syringe to accommodate through-hole components that are inserted and reflow-soldered together with the surface-mount components.

1.5.6 Leaching
The loss or removal of a basis metal or coating during a soldering operation.

1.5.7 Meniscus (Component)
Sealant or encapsulant on a lead, protruding from the seating plane of the component. This includes materials such as ceramic, epoxy or other composites, and flash from molded components.

1.5.8 Nonfunctional Land
A land that is not connected electrically to the conductive pattern on its layer.

1.5.9 Pin-in-Paste
See Intrusive Solder

1.5.10 Wire Diameter
In this document, wire diameter (D) is the overall diameter of conductor including insulation. Unless otherwise specified, criteria in this standard are applicable for solid wire/component leads or stranded wire.

1.5.11 Wire Overwrap
When a wire/lead that is wrapped more than 360° and remains in contact with the terminal post, Figure 6-64A.

1.5.12 Wire Overlap
When a wire/lead that is wrapped more than 360° and crosses over itself, i.e., does not remain in contact with the terminal post, Figure 6-64B.

1.6 Examples and Illustrations
Many of the examples (illustrations) shown are grossly exaggerated in order to depict the reasons for this classification.

It is necessary that users of this standard pay particular attention to the subject of each section to avoid misinterpretation.
1.7 Inspection Methodology

Accept and/or reject decisions shall be based on applicable documentation such as contract, drawings, specifications and referenced documents.

The inspector does not select the class for the assembly under inspection, see 1.3. Documentation that specifies the applicable class for the assembly under inspection shall be provided to the inspector.

Automated Inspection Technology (AIT) is a viable alternative to visual inspection and complements automated test equipment. Many of the characteristics in this document can be inspected with an AIT system. IPC-AI-641 "User's Guidelines for Automated Solder Joint Inspection Systems" and IPC-AI-642 "User's Guidelines for Automated Inspection of Artwork, Inner-layers, and Unpopulated PCBs" provide more information on automated inspection technologies.

If the customer desires the use of industry standard requirements for frequency of inspection and acceptance, J-STD-001 is recommended for further soldering requirement details.

1.8 Verification of Dimensions

The actual measurements provided in this document (i.e., specific part mounting and solder fillet dimensions and determination of percentages) are not required except for referee purposes. All dimensions in this standard are expressed in SI (System International) units (with Imperial English equivalent dimensions provided in brackets). All specified limits in this standard are absolute limits as defined in ASTM E29.

1.9 Magnification Aids and Lighting

For visual inspection, some individual specifications may call for magnification aids for examining printed board assemblies.

The tolerance for magnification aids is ± 15% of the selected magnification power. Magnification aids, if used for inspection, shall be appropriate with the item being inspected. Unless magnification requirements are otherwise specified by contractual documentation, the magnifications in Table 1-2 and Table 1-3 are determined by the item being inspected.

Referee conditions are used to verify product rejected at the inspection magnification power. For assemblies with mixed land widths, the greater magnification may be used for the entire assembly.

### Table 1-2 Inspection Magnification (Land Width)

<table>
<thead>
<tr>
<th>Land Widths or Land Diameters</th>

<td>Notes 1,2</td>
</tr>
<tr>
<td>Marking</td>
<td>Note 2</td>
</tr>
<tr>
<td>Other (Component and wire damage, etc.)</td>
<td>Note 1</td>
</tr>
</tbody>
</table>

**Note 1:** Visual inspection may require the use of magnification, e.g. when fine pitch or high density assemblies are present, magnification may be needed to determine if contamination affects form, fit or function.

**Note 2:** If magnification is used it is limited to 4X maximum.
1.10 Lighting

Lighting shall be adequate for the item being inspected.

Illumination at the surface of workstations should be at least 1000 lm/m² [approximately 93 foot candles]. Light sources should be selected to prevent shadows.

Note: In selecting a light source, the color temperature of the light is an important consideration. Light ranges from 3000–5000° K enable users to distinguish various printed circuit assembly features and contaminates with increased clarity.
3 Handling Electronic Assemblies

This chapter provides general guidelines and there were only minor editorial changes to help with understanding. There are no changes in criteria.
4 Hardware

This section illustrates several types of hardware used to mount electronic devices to a printed circuit assembly (PCA) or any other types of assemblies requiring the use of any of the following: screws, bolts, nuts, washers, fasteners, clips, component studs, tie downs, rivets, connector pins, etc. This section is primarily concerned with visual assessment of proper securing (tightness), and also with damage to the devices, hardware, and the mounting surface that can result from hardware mounting. Compliance to torque requirements is to be verified as specified by customer documentation. The verification procedure ensures that no damage to components or assembly occurs. Where torque requirements are not specified, follow standard industry practices.

Process documentation (drawings, prints, parts list, build process) will specify what to use; deviations need to have prior customer approval.

Note: Criteria in this section do not apply to attachments with self-tapping screws.

Visual inspection is performed in order to verify the following conditions:

a. Correct parts and hardware.
b. Correct sequence of assembly.
c. Correct security and tightness of parts and hardware.
d. No discernible damage.
e. Correct orientation of parts and hardware.

The following topics are addressed in this section:

4.1 Hardware Installation
  4.1.1 Electrical Clearance
  4.1.2 Interference
  4.1.3 Heatsinks
  4.1.3.1 Insulators and Thermal Compounds
  4.1.3.2 Contact
  4.1.4 Threaded Fasteners
  4.1.4.1 Torque
  4.1.4.2 Wires

4.2 Jackpost Mounting

4.3 Connector Pins
  4.3.1 Edge Connector Pins
  4.3.2 Press Fit Pins
  4.3.2.1 Soldering

4.4 Wire Bundle Securing
  4.4.1 General
  4.4.2 Lacing
  4.4.2.1 Lacing- Damage

4.5 Routing
  4.5.1 Wire Crossover
  4.5.2 Bend Radius
  4.5.3 Coaxial Cable
  4.5.4 Unused Wire Termination
  4.5.5 Ties over Splices and Ferrules
4.1 Hardware Installation

4.1.1 Hardware Installation - Electrical Clearance

Also see 1.5.3 1.4.5.

Figure 4-1 610D-04-001

1. Metallic hardware
2. Conductive pattern
3. Specified minimum electrical clearance
4. Mounted component
5. Conductor

Acceptable - Class 1, 2, 3
• Spacing between noncommon conductors does not violate specified minimum electrical clearance (3). This is shown in Figure 4-1 as the distances between (1) & (2) and (1) & (5).

Defect - Class 1, 2, 3
• Hardware reduces spacing to less than specified minimum electrical clearance.

Figure 4-2 610D-04-002

1. Metallic hardware
2. Conductive pattern
3. Specified minimum electrical clearance
4. Mounted component
5. Conductor

Figure 4-3 610D-04-003

Acceptable – Class 1, 2, 3
• Mounting area clear of obstructions to assembly requirements.

Defect - Class 1, 2, 3
• Excess solder (uneven) on mounting holes where mechanical assembly will be affected.
• Anything that interferes with mounting of required hardware.
4.1.3 Heatsinks <moved here from 610D 7.2, damaged heat sink moved to 9.12>

4.1.3.1 Heatsinks - Insulators and Thermal Compounds

This section illustrates various types of heatsink mounting. Bonding with thermally conductive adhesives may be specified in place of hardware.

Visual inspection includes hardware security, component damage, and correct sequence of assembly.

- The following additional issues need to **shall** be considered:
  - The component has good contact with the heatsink.
  - The hardware secures the component to the heatsink.
  - The component and heatsink are flat and parallel to each other.
  - The thermal compound/insulator (mica, silicone grease, plastic film, etc.) is applied properly.

**Figure 4-4 610D-7-52**

**Target - Class 1,2,3**
- Uniform border of mica, plastic film or thermal compound showing around edges of component.

**Figure 4-5 610D-7-53**

**Acceptable - Class 1,2,3**
- Not uniform but evidence of mica, plastic film or thermal compound showing around edges of component.

**Figure 4-6 610D-7-54**

**Defect - Class 1,2,3**
- No evidence of insulating materials, or thermal compound (if required).
- Thermal compound precludes formation of required solder connection.

Illustrations and text are copyright IPC and may be copied only for use in development of IPC-A-610 Revision E.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used. Clause number changes as a result of reorganizing within this chapter are not shown.

### 4.1.3.2 Heatsink - Contact

**Target - Class 1,2,3**
- Component and heatsink are in full contact with the mounting surface.
- Hardware meets specified attachment requirements.

**Acceptable - Class 1,2,3**
- Component not flush.
- Minimum 75% contact with mounting surface.
- Hardware meets mounting torque requirements if specified.

**Defect - Class 1,2,3**
- Component has less than 75% contact with mounting surface.
- Hardware is loose.

1. Gap  
2. Heat sink

#### Figure 4-9  610D-7-57
1. Heat sink  
2. Gap

### 4.1.4.1.3. Hardware Installation - Threaded Fasteners

A minimum of one and one half threads need to extend beyond the threaded hardware, (e.g., nut) unless otherwise specified by engineering drawing. Bolts or screws may be flush with the end of the threaded hardware only where threads could interfere with other components or wires and when locking mechanisms are used.

Thread extension should not be more than 3 mm [0.12 in] plus one and one-half threads for bolts or screws up to 25 mm [0.984 in] long or more than 6.3 mm [0.248 in] plus one and one-half threads for bolts or screws over 25 mm [0.984 in]. This is providing that the extension does not interfere with any adjacent part and that the designed electrical clearance requirements are met.

Both the order and orientation of mounting hardware need to be considered during assembly. Devices such as “star” or “tooth” washers may have one side with sharp edges intended to cut into the mating surface to keep the hardware from coming loose in operation. Figure 4-11 is an example of this kind of lock washer. Unless otherwise specified the sharp edges of the lock washer should be against the flat washer.

#### Figure 4-10  610D-04-004
1. Lock washer  
2. Flat washer  
3. Nonmetal  
4. Metal (not conductive pattern or foil)

**Acceptable - Class 1, 2, 3**
- Proper hardware sequence and orientation. Figures 4-10 and 4-11.
- Slot or hole are covered with flat washer, Figure 4-12.
- Hole is covered with flat washer, Figure 4-5.
Acceptable - Class 1
Defect – Class 2, 3

- Less than one and one-half threads extend beyond the threaded hardware, (e.g., nut) unless thread extension would interfere with other component.
- Thread extension more than 3 mm [0.12 in] plus one and one-half threads for bolts or screws up to 25 mm [0.984 in].
- Thread extension more than 6.3 mm [0.248 in] plus one and one-half threads for bolts or screws over 25 mm [0.984 in].
- Bolts or screws without locking mechanisms extend less than one and one half threads beyond the threaded hardware.

Defect - Class 1, 2, 3
- Thread extension interferes with adjacent component.
- Hardware material or sequence not in conformance with drawing.
- Lock washer against nonmetal/laminate.
- Flat washer missing, Figure 4-13.
- Hardware missing or improperly installed, Figure 4-14.

2. Nonmetal
3. Metal (not conductive pattern or foil)

Figure 4-14 new

Figure 4-15 610D-04-007
1. Slot or hole
2. Lock washer

**4.1.4.1. Hardware Installation - Threaded Fasteners – Torque**

Where torque requirements are not specified, follow standard industry practices. When connections are made using threaded fasteners, they must be tight to ensure the reliability of the connection. When split ring type lock washers are used, the threaded fastener must be tight enough to compress the lock washer. Fastener torque value, if specified, is within limits.<changed to criteria bullets below>

Acceptable - Class 1, 2, 3
- Fasteners are tight and split-ring lock washers, when used, are fully compressed.
- Fastener torque value, if specified, is within limits.

Defect - Class 1, 2, 3
- Lock washer not compressed.
- Fastener torque value, if specified, is not within limits.

Figures 4-16 610D-04-008

Figures 4-17 610D-04-009

Figure 4-18 Graphics working group Aug09
4.1.4.2.4.4.3.2 Hardware Installation – Threaded Fasteners - Wires

When the use of terminal lugs is not required, wires are wrapped around screw type terminals in a manner that precludes loosening when the screw is tightened, and the ends of the wire are kept short to preclude shorting to ground or other current carrying conductors.

If a washer is used, the wire/lead is mounted under the washer.

Unless otherwise noted, all requirements apply to both stranded and solid wires.

Special hardware staking/Securing criteria may be required.

**Figure 4-19  610D-04-010**

Target – Class 1, 2, 3
- Original lay of the strands is not disturbed (stranded wire).
- Wire wrapped a minimum of 270° around the screw body.
- Wire end secured under screw head.
- Wire wrapped in the correct direction.
- All strands are under screw head.

**Figure 4-20  610D-04-011**

Acceptable - Class 1, 2, 3
- Wire wrapped around the screw body in the correct direction, but a few strands have unraveled in tightening the screw.
- Less than 1/3 of the wire diameter protrudes from under the screw head.
- Wire extending outside the screw head does not violate minimum electrical clearance.
- Mechanical attachment of the wire is in contact between the screw head and the contact surface for a minimum of 180° around the screw head.
- No insulation in the contact area.
- Wire does not overlap itself.

**Figure 4-21  610D-04-012**

Defect - Class 1, 2, 3
- Wire not wrapped around screw body (A).
- Wire is overlapped (B).
- Solid wire wrapped in wrong direction (C).
- Stranded wire wrapped in wrong direction (tightening the screw unwinds the twisted wire) (D).
- Insulation in the contact area (E).
- Stranded wire is tinned (not shown).
- Missing solder or adhesive as required per customer requirements (not shown).

Illustrations and text are copyright IPC and may be copied only for use in development of IPC-A-610 Revision E.
4.2 Connectors, Handles, Extractors, Latches Moved to new 9.8
4.2 Jackpost Mounting

This section covers the height relationship of the face of the jackpost to the associated connector face. This is critical to obtain maximum connector pin contact.

Hardware stack-up for mounted connectors may be varied in order to locate the face of the jackpost flush to 0.75 mm [0.030 in] below the face of the connector.

Acceptable - Class 1, 2, 3
- Jackpost face is flush to 0.75 mm [0.030 in] below the face of the connector.
- Height is obtained by adding or removing washers (supplied with jackpost).

Defect - Class 1, 2, 3
- Jackpost face extends above the connector face (Figure 4-24).
- Face of jackpost is greater than 0.75 mm [0.030 in] below the connector face (Figure 4-25).

4.3 Connector Pins

This section covers two types of pin installations; edge connector pins and connector pins. Installation of these devices is usually done with automated equipment. Visual inspection of this mechanical operation includes: correct pins, damaged pins, bent and broken pins, damaged spring contacts and damage to the substrate or conductive pattern. For connector mounting criteria see 7.1.8. For connector damage criteria see 9.5.

4.3.1 Connector Pins - Edge Connector Pins

Acceptable - Class 1, 2, 3
- Contact is not broken or twisted.
- Gap is within specified tolerance.
- No land damage.
- Contact is contained within the insulator.

Defect - Class 1, 2, 3
- Contact is above insulator (A).
- Contacts are twisted or otherwise deformed (B).
- Land is damaged (C).
- Contact is broken (D).
- Gap between contact shoulder and land is greater than specified (B).

Note: To provide allowance for an extraction tool, the gap between the contact shoulder and the land needs to be adequate for each manufacturer's repair tooling.
4.3.2 Connector Pins - Press Fit Pins

**Figure 4-28  610D-04-018**

1. No discernible damage
2. Land
3. No discernible twist

**Figure 4-29  610D-04-019**

1. Pin height tolerance
2. Less than 50% pin thickness

**Target – Class 1, 2, 3**
- Pins are straight, not twisted and properly seated.
  - No discernible damage.

**Acceptable - Class 1, 2, 3**
- Pins are slightly bent off center by 50% pin thickness or less.
  - Pin height varies within tolerance.

**Note:** Nominal height tolerance is per pin connector or master drawing specification. The connector pins and mating connector must have a good electrical contact.

**Defect - Class 1, 2, 3**
- Pin is bent out of alignment. (Pin is bent off center greater than 50% pin thickness.)
  - Pin visibly twisted.
  - Pin height is out of tolerance as to specification.

**Defect - Class 1, 2, 3**
- Moved to 9.1

**Acceptable – Class 1, 2, 3**
- No lifted or fractured annular rings with press fit pins.

**Acceptable - Class 1, 2**
- Less than or equal to 75% of the width (W) of the annular ring is lifted.
- Damaged nonfunctional lands for single and double-sided boards are acceptable if firmly attached to board in unlifted areas.
- Protrusion side land lifted less than or equal to 75% of the width (W) of the annular ring, figure - 33.

Illustrations and text are copyright IPC and may be copied only for use in development of IPC-A-610 Revision E.
Acceptable – Class 2
- No visual evidence of lifted land on insertion side.

Acceptable – Class 3
- No lifted or fractured annular rings.

Defect – Class 1, 2
- Any protrusion side functional annular ring lifted more than 75% of the width (W).

Defect – Class 2
- Any evidence of lifted lands on the insertion side.

Defect – Class 3
- Any lifted or fractured annular rings with press fit pins.

Note: For additional information see 10.3.210.2.9.2
Conductor/Land Damage - Lifted Pads/Lands.

4.3.2.1 Press Fit Pins - Soldering

The term “press fit pins” is generic in nature and many types of pressure inserted pins, e.g. connector, staked, etc., are not intended to be soldered. If soldering is required the following criteria is applicable.

Target - Class 1, 2, 3
- A 360° solder fillet is evident on the secondary side of the assembly.

Note: Solder fillet or fill on primary side is not required.

Acceptable - Class 1, 2
- Solder fillet or coverage (secondary side) is present on two adjacent sides of the pin.

Acceptable – Class 3
- A 330° solder fillet is evident on the secondary side of the assembly.
Acceptable - Class 1

- Solder wicking is permitted above 2.5 mm [0.0984 in] on sides of pins provided there is no solder build up which interferes with subsequent attachments to the pin.

Acceptable - Class 2, 3

- Solder wicking on sides of pins is less than 2.5 mm [0.0984 in], provided the solder does not interfere with subsequent attachments to the pin.

Defect - Class 1, 2

- Solder fillet or coverage is evident on less than 2 adjacent sides of the pin on the secondary side.

Defect - Class 3

- Solder fillet is evident on less than four sides of the pin on the secondary side.
- Less than 330° solder fillet on the secondary side of the assembly.

Defect - Class 1, 2, 3

- Solder build up interferes with subsequent attachments to the pin.

Defect - Class 2, 3

- Solder wicking exceeds 2.5 mm [0.0984 in].

4.3.3 Connector Pins—Backplanes moved to Chapter 9

4.4 Wire Bundle Securing

Additional criteria can be found in IPC/WHMA-A-620.

4.4.1 Wire Bundle Securing – General

Note: Do not subject wax impregnated lacing tape to cleaning solvents. Beeswax is unacceptable for Class 3.

4.3 Connector Pins

- Backplanes moved to Chapter 9

4.4 Wire Bundle Securing

Additional criteria can be found in IPC/WHMA-A-620.

4.4.1 Wire Bundle Securing – General

Note: Do not subject wax impregnated lacing tape to cleaning solvents. Beeswax is unacceptable for Class 3.

Figure 4-39  610D-04-031

1. Bottom view
2. Side view
3. Land
4. Top view
5. PCB

Target - Class 1, 2, 3

- Restraining devices are neat and tight, and spaced to keep the wires secured in a tight neat bundle.

Acceptable - Class 1, 2, 3

- The end of the tie wrap/strap:
  - Protrudes a maximum of one tie wrap/strap thickness.
  - Is cut reasonably square to the face of the wrap.
  - The wires are secured in the wire bundle.

Illustrations and text are copyright IPC and may be copied only for use in development of IPC-A-610 Revision E.
4.4.2 Wire Bundle Securing - Lacing

Lacing differs from cable ties because it is a continuous lace. Lacing has closer spacing than cable ties. Criteria for cable ties apply to lacing.

**Note:** Do not subject wax impregnated lacing tape to cleaning solvents. Beeswax is unacceptable for Class 3.
4.4.2.1 Wire Bundle Securing - Lacing - Damage

**Figure 4-49  610D-04-044**

Target – Class 1, 2, 3
- Restraining devices are not worn, frayed, nicked, or broken in any location.
- Restraining devices do not have sharp edges that may be a hazard to personnel or equipment.

Acceptable – Class 1, 2

**Defect – Class 3**
- Restraining devices exhibit minor fraying, nicks, or wear of less than 25% of the device thickness.

Defect – Class 1, 2
- Damage or wear to restraining device greater than 25% of the device thickness (1).

Defect – Class 3
- Cut end of lacing has not been heat seared.
- Heat searing touches knot.
- Ends of lacing tape is frayed.

Defect – Class 1, 2, 3
- Sharp edges that are a hazard to personnel or equipment (2).
- Broken lacing ends are not tied off using a square knot, surgeons knot, or other approved knot (3).

**Figure 4-50 replace with 620A Fig 14-14 <Sept07>**
4.5 Routing

These criteria are applicable to single wires or wire bundles.

Wires in wire bundles are positioned to minimize crossover and maintain a uniform appearance.

4.5.1 Routing – Wire Crossover

<table>
<thead>
<tr>
<th>Figure 4-51 610D-04-046</th>

</tr>
<tr>
<td>Harness assembly</td>
</tr>
</tbody>
</table>

**Note 1:** OD is the outer diameter of the wire or cable, including insulation.

**Note 2:** Coaxial Fixed Cable - Coaxial cable that is secured to prevent movement; not expected to have the cable repeatedly flexed during operation of the equipment.

**Note 3:** Coaxial Flexible Cable - Coaxial cable that is or may be flexed during operation of the equipment.

**Acceptable – Class 1, 2, 3**
- Minimum bend radius meets requirements of Table 4-1.

**Defect – Class 1, 2, 3**
- Bend radius is less than the minimum bend radius requirements of Table 4-1.
4.5.3 Routing – Coaxial Cable

**Figure 4-54  610D-04-049**

Acceptable - Class 1, 2, 3
- Inside bend radius meets the criteria of Table 4-1.

**Figure 4-55  610D-04-050**

Defect - Class 1, 2, 3
- Inside bend radius does not meet the criteria of Table 4-1.

Defect - Class 3
- Tie wraps/straps that cause any deformation of coaxial cables.

4.5.4 Routing – Unused Wire Termination

**Figure 4-56  610D-04-052**

Target - Class 1, 2, 3
- Sleeving extends three wire diameters past end of wire.
- Unused wire is folded back and tied into the wire bundle.

**Figure 4-57  610D-04-051**

Acceptable - Class 1, 2, 3
- Ends of unused wires are covered with shrink sleeving.
- Wire may extend straight down length of bundle (Figure 4-59) or be folded back (Figure 4-60).
- Sleeving extends at least 2 wire diameters beyond end of wire.
- Sleeving extends onto the wire insulation for a minimum of 4 wire diameters or 6 mm [0.24 in], whichever is greater.
- Unused wire is tied into the wire bundle.

Process Indicator - Class 2
Defect - Class 3
- Insulating sleeving extends beyond end of wire less than two wire diameters.
- Insulating sleeving extends onto wire insulation less than 4 wire diameters or 6 mm [0.24 in], whichever is greater.

**Figure 4-58  610D-04-053**

Defect - Class 1, 2, 3
- Ends of unused wires are exposed.
- Unused wire is not tied into the wire bundle.
4.5.5 Routing – Ties over Splices and Ferrules

**Figure 4-59  610D-04-054**

Acceptable - Class 1, 2, 3
- Tie wraps/straps are placed near splices or solder ferrules contained in the wire bundle.
- No stress on wires exiting splices.

Acceptable - Class 1
Process Indicator – Class 2
Defect – Class 3
- Tie wraps/straps are placed over splices or solder ferrules contained in the wire bundle.

**Figure 4-60  610D-04-055**

Defect-Class 1, 2, 3
- Tie wrap/strap is placing stress on the wire(s) exiting the splice.

**Figure 4-61  610D-04-056**
5 Soldering

This section establishes the acceptability requirements for soldered connections of all types, e.g., SMT, terminals, through-hole, etc. Although Class 1, 2 and 3 applications and environments have been considered, the nature of the soldering process may dictate that an acceptable connection will have the same characteristics for all three classes, and an unacceptable connection would be rejected for all three classes.

Where appropriate, the type of soldering process used has been addressed specifically in the criteria description. In any case, the connection criteria apply regardless of which methods of soldering have been utilized, for example:

- Soldering irons.
- Resistance soldering apparatus.
- Induction wave, or drag soldering.
- Reflow soldering.
- Intrusive soldering.

As an exception to the above, there are specialized soldering finishes, (e.g., immersion tin, palladium, gold, etc.) that require the creation of special acceptance criteria other than as stated in this document. The criteria should be based on design, process capability and performance requirements.

Wetting cannot always be judged by surface appearance. The wide range of solder alloys in use may exhibit from low or near zero degree contact angles to nearly 90° contact angles as typical. The acceptable solder connection must indicate evidence of wetting and adherence where the solder blends to the soldered surface.

The solder connection wetting angle (solder to component and solder to PCB termination) is shall not exceed 90° (Figure 5-1 A, B). As an exception, the solder connection to a termination may exhibit a wetting angle exceeding 90° (Figure 5-1 C, D) when it is created by the solder contour extending over the edge of the solderable termination area or solder resist.

Figure 5-1 620D-05-001

The primary difference between the solder connections created with processes using tin-lead alloys and processes using lead free alloys is related to the visual appearance of the solder. This standard provides visual criteria for inspection of both tin-lead and lead free connections. Figures specific to lead free connections will be identified with the symbol:

Acceptable lead free and tin lead connections may exhibit similar appearances but lead free alloys are more likely to have:

- Surface roughness (grainy or dull).
- Greater wetting contact angles.

All other solder fillet criteria are the same.

Typical tin-lead connections have from a shiny to a satin luster, generally smooth appearance and exhibit wetting as exemplified by a concave meniscus between the objects being soldered. High temperature solders may have a dull appearance. Touch up (rework) of soldered connections is performed with discretion to avoid causing additional problems, and to produce results that exhibit the acceptability criteria of the applicable class.

The following topics are addressed in this section:

5.1 Soldering Acceptability Requirements

5.2 Soldering Anomalies
   5.2.1 Exposed Basis Metal
   5.2.2 Pin Holes/Blow Holes
   5.2.3 Reflow of Solder Paste
5.2.4 Nonwetting
5.2.5 Cold/Rosin Connection
5.2.6 Dewetting
5.2.7 Excess Solder
5.2.7.1 Excess Solder- Solder Balls/Solder Fines
5.2.7.2 Excess Solder- Bridging
5.2.7.3 Excess Solder- Solder Webbing/Splashes
5.2.8 Disturbed Solder
5.2.9 Fractured Solder
5.2.10 Solder Projections
5.2.11 Lead Free Fillet Lift
5.2.12 Lead Free Hot Tear/Shrink Hole
5.2.13 Probe Marks and Other Similar Surface Conditions in Solder Joints

5.1 Soldering Acceptability Requirements

See 5.2 for examples of soldering anomalies.

**Figure 5-2 620D-05-002**

**Target – Class 1, 2, 3**
- Solder fillet appears generally smooth and exhibits good wetting of the solder to the parts being joined.
- Outline of the parts is easily determined.
- Solder at the lead being joined creates a feathered edge.
- Fillet is concave in shape.

**Acceptable - Class 1, 2, 3**
- There are materials and processes, e.g. lead free alloys and slow cooling with large mass PCBs, that may produce dull matte, gray, or grainy appearing solders that are normal for the material or process involved. These solder connections are acceptable.
- The solder connection wetting angle (solder to component and solder to PCB termination) do not exceed 90º (Figure 5-1 A, B).
  - As an exception, the solder connection to a termination may exhibit a wetting angle exceeding 90 º (Figure 5-1 C, D) when it is created by the solder contour extending over the edge of the solderable termination area or solder resist.

The primary difference between the solder connections created with processes using tin-lead alloys and processes using lead free alloys is related to the visual appearance of the solder. This standard provides visual criteria for inspection of both tin-lead and lead-free connections. In this Standard, figures specific to lead-free connections will be identified with the symbol shown in Figure 5-3.

**Figure 5-3**

Acceptable lead-free and tin-lead connections may exhibit similar appearances but lead free alloys are more likely to have surface roughness (grainy or dull) or greater wetting contact angles.

Illustrations and text are copyright IPC and may be copied only for use in development of IPC-A-610 Revision E.
Solder fillet criteria for SnPb and lead-free alloys are the same.

Typical tin-lead connections have from a shiny to a satin luster, generally smooth appearance and exhibit wetting as exemplified by a concave meniscus between the objects being soldered. High temperature solders may have a dull appearance. Touch-up (rework) of soldered connections is performed with discretion to avoid causing additional problems, and to produce results that exhibit the acceptability criteria of the applicable class.

Figures 5–4 through 5–25 illustrate acceptable solder connections with various solder alloys and process conditions. These figures were removed from this chapter but are displayed in appropriate places throughout Revision E.

5.2 Soldering Anomalies

5.2.1 Soldering Anomalies - Exposed Basis Metal

Exposed basis metal on component leads, conductors or land surfaces from nicks, scratches, or other conditions cannot exceed the requirements of 7.1.2.3 for leads and 10.2.9.1 for conductors and lands.

Component leads, sides of land patterns, conductors, and use of liquid photoimageable solder resist can have exposed basis metal per original designs.

Some printed circuit board and conductor finishes have different wetting characteristics and may exhibit solder wetting only to specific areas. Exposed basis metal or surface finishes should be considered normal under these circumstances, provided the achieved wetting characteristics of the solder connection areas are acceptable.

Acceptable - Class 1, 2, 3

- Exposed basis metal on:
  - Vertical conductor edges.
  - Cut ends of component leads or wires.
  - Organic Solderability Preservative (OSP) coated lands.

Acceptable - Class 1

Process Indicator - Class 2, 3

- Exposed basis metal on component leads, conductors or land surfaces from nicks or scratches provided conditions do not exceed the requirements of 7.1.2.3 for leads and 10.3.1 for conductors and lands.

Defect – Class 1, 2, 3

- Exposed basis metal on component leads, conductors, or land surfaces from nicks, scratches, or other conditions exceed the requirements of 7.1.2.3 and 10.3.1.
5.2.2 Soldering Anomalies - Pin Holes/Blow Holes

<table>

</tbody>
</table>

**Acceptable - Class 1**

**Process Indicator - Class 2, 3**

- Blowholes (Figures 5-8, 9), pinholes (Figure 5-10), voids (Figures 5-11, 12), etc., providing the solder connection meets all other requirements.

**Defect – Class 1, 2, 3**

- Solder connections where pin holes, blow holes, voids, etc. reduce the connections below minimum requirements (not shown).

5.2.3 Soldering Anomalies - Reflow of Solder Paste

<table>

</tr>
</tbody>
</table>

**Defect - Class 1, 2, 3**

- Incomplete reflow of solder paste.

5.2.4 Soldering Anomalies - Nonwetting

IPC-T-50 defines nonwetting as the inability of molten solder to form a metallic bond with the basis metal. In this Standard, that includes surface finishes, see 5.2.1.

<table>
<thead>

</table>
5.2.5 Soldering Anomalies – Cold/Rosin Connection

IPC-T-50 defines cold solder connection as “A solder connection that exhibits poor wetting, and that is characterized by a grayish, porous appearance. (This is due to excessive impurities in the solder, inadequate cleaning prior to soldering, and/or the insufficient application of heat during the soldering process.)” A rosin solder connection is defined in IPC-T-50 as “A solder connection that has practically the same appearance as does a cold solder connection, but that also shows evidence of entrapped rosin separating the surfaces to be joined.”

Figure 5-22 New

Defect - Class 1, 2, 3
- Nonwetting or incomplete wetting as a result of a cold (Figure 5-22) or rosin (not shown) connection.

5.2.6 Soldering Anomalies – Dewetting

IPC-T-50 defines dewetting as a condition that results when molten solder coats a surface and then recedes to leave irregularly-shaped mounds of solder that are separated by areas that are covered with a thin film of solder and with the basis metal or surface finish not exposed.

Figure 5-23 610D-05-041
Figure 5-24 610D-05-042
Figure 5-25 610D-05-043
Figure 5-26 610D 6-105

Defect - Class 1, 2, 3
- Evidence of dewetting that causes the solder connection to not meet the SMT or thru-hole solder fillet requirements.

5.2.7 Soldering Anomalies – Excess Solder

Metal lidded components

Solder splashes or tinning on a metalized package body (see Figure 5-27) should be evaluated for impact upon hermetic and radiation hardening performance of the component considering the intended performance environment. Solder splashes on the metalized surfaces may be acceptable if the extended electrical performance is not required or compromised.

Figure 5-27 new
5.2.7.1 Soldering Anomalies - Excess Solder- Solder Balls/Solder Fines

Solder balls are spheres of solder that remain after the soldering process. Solder fines are typically small balls of the original solder paste metal screen size that have splattered around the connection during the reflow process.

Figure 5-28 610D-05-044  
**Target – Class 1, 2, 3**  
- No evidence of solder balls on the printed wiring assembly.

Figure 5-29 new  
**Acceptable – Class 1, 2, 3**  
- Solder balls are entrapped/encapsulated and do not violate minimum electrical clearance.  
- Solder balls are entrapped, encapsulated or attached (e.g. in no-clean residue, with conformal coating, soldered to a metal surface, embedded in the solder resist or under a component).  
- Solder balls do not violate minimum electrical clearance.

Note: Entrapped/encapsulated/attached is intended to mean that normal service environment of the product will not cause a solder ball to become dislodged.

Figure 5-30 610D-05-046  
Figure 5-31 610D-05-047  
Figure 5-32 610D-05-048  
Figure 5-33 new

**Defect - Class 1, 2, 3**  
- Solder balls are not entrapped, encapsulated or attached and can become dislodged in the normal service environment.  
- Solder balls violate minimum electrical clearance.  
- Solder balls are not entrapped in no-clean residue or encapsulated with conformal coating, or not attached (soldered) to a metal surface, Figures 5-29 through 5-32.

5.2.7.2 Soldering Anomalies - Excess Solder- Bridging

Figure 5-34 610D-05-050  
Figure 5-35 610D-05-051  
Figure 5-36 610D-05-052  
Figure 5-37 new

**Defect - Class 1, 2, 3**  
- A solder connection across conductors that should not be joined.  
- Solder has bridged to adjacent noncommon conductor or component.
### 5.2.7.3 Soldering Anomalies - Excess Solder - Solder Webbing/Splashes

**Inspection for solder splashes** **shall** **be done without** magnification.

**Target** – Class 1, 2, 3
- No solder splashes or webbing.

**Acceptable** – Class 1, 2, 3
- Solder splashes or metallic particles meet the following criteria:
  - Attached/entrapped/encapsulated on the PCA surface or solder mask, or soldered to metallic surface.
  - Do not violate minimum electrical clearance.

**Defect** - Class 1, 2, 3
- Solder splashes.
- Solder splashes that are not attached, entrapped, encapsulated.
- Solder splashes on metal component surfaces impact form, fit or function, e.g. damages lid seal on hermetic components.
- Violate minimum electrical clearance.

**Note:** Entrapped/encapsulated/attached is intended to mean that normal service environment of the product will not cause solder to become dislodged.

---

### 5.2.8.2.7 Soldering Anomalies - Disturbed Solder

Surface appearance with cooling lines as shown in Acceptable Figures 5-40 (lead free) and 5-41 (SnPb) are more likely to occur in lead free alloys and are not a disturbed solder condition.

**Acceptable** - Class 1, 2, 3
- Lead free and tin-lead solder connections exhibit:
  - cooling lines (Figures 5-40).
  - Secondary reflow (Figure 5-41).

**Defect** - Class 1, 2, 3
- Disturbed solder joint characterized by stress lines from movement in the connection.
- Disturbed solder joint characterized by uneven surface from movement in the solder connection during cooling.
5.2.9 Soldering Anomalies - Fractured Solder

Figure 5-44 610D-05-061
Defect - Class 1, 2, 3
- Fractured or cracked solder.

Figure 5-45 610D-05-062

Figure 5-46 new

5.2.10 Soldering Anomalies - Solder Projections

Figure 5-47 610D-05-063
Defect - Class 1, 2, 3
- Solder projection, Figure 5-47, violates assembly maximum height requirements or lead protrusion requirements.
- Projection, Figure 5-48 violates minimum electrical clearance (1).

Figure 5-48 610D-05-064

Figure 5-49 610D-05-065

5.2.11 Soldering Anomalies – Lead Free Fillet Lift

These criteria are applicable to plated-through hole connections.

Figure 5-50 610D-05-066
Acceptable – Class 1, 2, 3
- Fillet lifting - separation of the bottom of the solder and the top of the land.

Note: (From IPC-T-50H) Fillet lifting is the phenomenon in which the solder fillet is lifted off from the land on a board mainly during the flow solder process. The phenomenon is more likely to occur on the primary (solder destination) side rather than on the secondary (solder source) side which is exposed to flow soldering. Figure 5-51 is a microsection view of fillet lifting.

There is no defect associated with this anomaly.

Figure 5-51 new

Note: See 10.3.2 for criteria related to land damage that may be caused by fillet lifting.

Process Indicator – Class 2
Defect – Class 3
- Fillet lifting – separation of the bottom of the solder and the top of the land on the secondary side of plated-through hole connection (not shown).

Defect – Class 1, 2, 3
- Fillet lifting damages the land attachment, see 10.2.9.2.
5.2.12 Soldering Anomalies – Lead Free Hot Tear/Shrink Hole

There is no defect associated with this anomaly provided the connection meets all other acceptance criteria. Figures 5-52 and 5-53 are examples of hot tear.

Figure 5-52 610D-05-067

Figure 5-53 new

Acceptable – Class 1, 2, 3
• For connections made with lead free alloys:
  • The bottom of the tear is visible.
  • The tear or shrink hole does not contact the lead, land or barrel wall.

Defect – Class 1, 2, 3
• Shrink holes or hot tear in connections made with SnPb solder alloys.
• For connections made with lead free alloys:
  • The bottom of the shrink hole or hot tear is not visible.
  • The tear or shrink hole contacts the lead or land.

5.2.13 Probe Marks and Other Similar Surface Conditions in Solder Joints

Target – Class 1, 2, 3
• The solder joint is free of any probe marks and other similar surface conditions.

Acceptable – Class 1, 2, 3
• Probe marks and other similar surface conditions that do not violate other requirements.

Defect – Class 1, 2, 3
• Probe marks and other similar surface conditions cause damage in excess of requirements.
6 Terminal Connections

These criteria apply to both wires and component leads. The target wrap conditions achieve a mechanical connection between the lead/wire and the terminal sufficient to assure that the lead/wire does not move during the soldering operation. Typically the mechanical connection includes a 180 º mechanical wrap to effect mechanical connection.

As an exception to the wrap conditions described above, it is acceptable when attaching leads/wires to bifurcated, slotted, pierce, punched or perforated terminals for the lead/wire to extend straight through the opening of the terminal with no wrap. Except for slotted terminals (6.10) leads/wires with no wrap need to be staked, bonded, or constrained to a degree that the attachment is mechanically supported, see 6.9.1 and 6.9.3. The purpose is to prevent transmission of shock, vibration, and movement of the attached wires that could degrade the solder connection.

The criteria in this section are grouped together in sixteen main subsections. Not all combinations of wire/lead types and terminal types can possibly be covered explicitly, so criteria is typically stated in general terms to apply to all similar combinations. For example, a resistor lead and a multistranded jumper wire connected to turret terminals have the same wrap and placement requirements, but only the multistranded wire could be subject to birdcaging.

In addition to the criteria in this section the criteria of Section 5 are applicable – solder connections must meet the criteria of Section 5.

The following topics are addressed in this section:

6.1 Swaged Hardware
   6.1.1 Terminals
      6.1.1.1 Terminal Base – Pad Gap
      6.1.1.2 Terminals - Turret
      6.1.1.3 Terminals - Bifurcated
   6.1.2 Rolled Flange
   6.1.3 Flared Flange
   6.1.4 Controlled Split
   6.1.5 Solder

6.2 Insulation
   6.2.1 Damage
   6.2.2.1 Presolder
   6.2.2.2 Post-Solder
   6.2.3 Clearance
   6.2.4 Flexible Sleeve
      6.2.4.1 Placement
      6.2.4.2 Damage

6.3 Conductor
   6.3.1 Deformation
   6.3.2 Conductor – Strand Damage
   6.3.3 Strand Separation (Birdcaging) – Presolder
   6.3.4 Strand Separation (Birdcaging) – Post-Solder
   6.3.5 Tinning

6.4 Service Loops

6.5 Terminals - Stress Relief
   6.5.1 Bundle
   6.5.2 Lead/Wire Bend

6.6 Terminals – Lead/Wire Placement – General Requirements
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

6.7 Terminals – Solder – General Requirements

6.8 Terminals - Turrets and Straight Pins
  6.8.1 Lead/Wire Placement
  6.8.2 Solder

6.9 Terminals – Bifurcated
  6.9.1 Lead/Wire Placement - Side Route Attachments
  6.9.2 Lead/Wire Placement - Bottom and Top Route Attachments
  6.9.3 Lead/Wire Placement - Staked Wires
  6.9.4 Solder

6.10 Terminals - Slotted
  6.10.1 Lead/Wire Placement
  6.10.2 Solder

6.11 Terminals – Pierced/Perforated
  6.11.1 Lead/Wire Placement
  6.11.2 Solder

6.12 Terminals – Hook
  6.12.1 Lead/Wire Placement
  6.12.2 Solder

6.13 Terminals - Solder Cups
  6.13.1 Lead/Wire Placement
  6.13.2 Solder

6.14 Terminals – AWG 30 and Smaller Diameter Wires
  6.14.1 Lead/Wire Placement

6.15 Terminals – Series Connected

6.16 Terminals - Edge Clip - Position

6.16.2 Swaged Hardware

This section contains criteria for the basic types of swaged hardware.

Terminals

Swaged hardware that overhangs the land is acceptable if it does not violate minimum electrical clearance, see 1.5.3.

Solderability

Plating and solderability of swaged hardware should be consistent with appropriate plating and solderability specifications. See IPC/EIA J-STD-002 and IPC/EIA J-STD-003 for solderability requirements.
This section shows mechanical assembly of turret and bifurcated terminals. Terminals that are to be soldered to a land may be mounted so that they can be turned by hand, but are vertically stable.

### 6.1.1.1 Swaged Hardware – Terminal Base – Pad Gap

**Target - 1, 2, 3**
- Terminal base circumference is in full contact with the land, with no evidence of mechanical distortion of land.
- Terminal may be rotated by finger force once swaged.
- Terminal is vertically stable (no vertical movement).

**Acceptable - Class 1, 2, 3**
- Terminal base circumference has more than 270° contact with the land, with separation not exceeding 1 land thickness.
- Terminal may be rotated by finger force once swaged.
- Terminal is vertically stable (no vertical movement).

**Acceptable - Class 1, 2**
**Defect - Class 3**
- Terminal base circumference has more than 180° but less than 270° contact with the land, with separation not exceeding 2 land thicknesses.

**Defect - Class 1, 2, 3**
- Terminal is not vertically stable.

### 6.1.2.4.1 Swaged Hardware – Terminals - Turret

**Target – Class 1, 2, 3**
- Terminal intact and straight.

**Acceptable - Class 1, 2, 3**
- Terminal is bent, but the top edge does not extend beyond the base.

**Acceptable - Class 1**
**Defect - Class 2, 3**
- The top edge of the terminal is bent beyond the edge of the base.

**Defect - Class 1, 2, 3**
- The center post is fractured.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

### 6.1.1.3 Swaged Hardware – Terminals - Bifurcated

</tr>
</tbody>
</table>

### 6.1.2.1 Swaged Hardware – Rolled Flange

The rolled flange terminal is used for mechanical attachments where electrical attachment to a land is not required. Rolled flange attachments are not soldered to a PCB land pattern or installed on active circuitry. They may be installed on inactive and isolated circuitry.

#### Figure 6-7 J001D Fig 5-3

</tr>
</thead>
<tbody>
<tr>
<td>Burnishing and deformation required to form the terminal swage.</td>
</tr>
</tbody>
</table>

| Any two radial splits or cracks are separated by 90° or more. |
| Minor damage of the substrate. |
| No circumferential splits or cracks. |
| Splits or cracks do not enter the terminal shank. |
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

**Defect – Class 1, 2, 3**
- Any circumferential splits or cracks.
- Any splits or cracks that enter the terminal shank.
- More than three radial splits or cracks.
- Splits or cracks that are not separated by more than 90°.
- Radial splits or cracks are separated by less than 90°.
- Missing rolled flange pieces.
- Terminals installed on active circuitry or PTHs.
- Soldered rolled flange terminals.
- Any mechanical damage of the substrate beyond requirements; see 10.2.

### 6.1.3.2.2 Swaged Hardware - Flared Flange

The shank extending beyond the land surface is swaged to create an inverted cone, uniform in spread, and concentric to the hole.

The flange is not split, cracked or otherwise damaged to the extent that flux, oils, inks, or other liquid substances utilized for processing the printed wiring assemblies can be entrapped within the mounting hole.

Flared flange solder criteria is provided in 6.1.5.

#### Figure 6-8 610D Fig 6-4

Target – Class 1, 2, 3
- Flared flange is uniformly swaged and concentric to the hole.
- Strain or stress marks caused by flaring are kept to a minimum.
- The flange is swaged sufficiently tight to prevent movement in the Z-axis.

Acceptable - Class 1, 2, 3
- Split in flared flange does not enter into the barrel.
- Not more than three radial splits.
- Any Radial splits or cracks are separated by at least 90°.

#### Figure 6-9 610D Fig 6-5

Acceptable - Class 1
- Split in flared flange in barrel acceptable if soldered after swaging.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

**Defect - Class 1, 2, 3**
- Flared flange periphery uneven or jagged.
- Split enters into barrel; see Class 1 exception above.
- Any circumferential splits/cracks.
- More than three radial splits.
- Any two radial splits separated by less than 90°.
- Radial splits or cracks are separated by less than 90°.
- Missing flared flange pieces.

**6.1.46.2.3 Swaged Hardware - Controlled Split**

This form of swaged hardware is obtained by using scored hardware with a number of uniform segments. When swaged, each segment should conform to a particular angle.

Controlled split hardware is to be soldered as soon as possible after swaging to avoid oxidation.

**Figure 6-12 610D Fig 6-7**

**Target – Class 1, 2, 3**
- Flange is uniformly split and concentric to the hole.
- Split segments do not extend to the outside diameter of the land.
- Flange is swaged sufficiently tight to prevent movement in the z-axis.

**Figure 6-13 610D Fig 6-8**

**Acceptable - Class 1, 2, 3**
- Flange splits down to the board but not into the barrel.
- No circumferential splits or cracks.

**Figure 6-14 610D Fig 6-9**

**Acceptable – Class 1**

**Defect - Class 1, 2, 3**
- Flange damaged.
- Segments excessively deformed.
- Segment missing.
- Split enters into barrel.
- Any Circumferential splits/cracks.

**6.1.56.2.5 Swaged Hardware – Fused in Place Solder**

*These solder acceptance criteria are applicable to flared flange and flat set swaged hardware.*

The **flat set** flange is not split, cracked or otherwise damaged to the extent that flux, oils, inks, or other liquid substances utilized for processing the printed board can be entrapped within the mounting hole. **After swaging, the area is to be free of circumferential splits or cracks.**

The manufactured flange (head) of the eyelet needs to be in full contact with the land area.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

<td>100%</td>
<td>100%</td>
</tr>
</tbody>
</table>

Target – Class 1, 2, 3
- **360° fillet and wetting** Solder around periphery of flange to land.
- Good filleting of solder around flange.
- Good wetting of flange and terminal area.
- The swaged flange is need to be as close to the land as possible to prevent movement in the Z axis.
- Evidence of solder flow is discernible between swaged flange and land of the printed board or other substrate.

Acceptable - Class 1, 2
- Solder is around. Minimum of 270° fillet and wetting of flange to land.
- Any radial split is filled with solder.
- Fillet of Solder fillet is to at least 75% of flange height.

Acceptable - Class 3
- Solder is around. Minimum of 330° fillet and wetting of flange to land.
- No radial or circumferential splits.
- Fillet of Solder to fillet is at least 75% of flange height.

Defect – Class 1, 2
- Solder is Less than 270° fillet and wetting around flared flange or eyelet periphery to land.
- Any radial split not filled with solder.

Defect - Class 1, 2, 3
- Improperly swaged, flange not seated on terminal area.
- Any radial split not filled with solder.
- Solder fillet is not does not reach up to 75% of flared flange height or 100% of flat set eyelet height.
- Circumferential split of flared flange or eyelet.

Defect - Class 3
- Solder is around less than 330° around of flange.
- Any radial or circumferential split in flange.
6.2 Insulation

6.2.1 Insulation – Damage

6.2.2 Insulation – Damage – Presolder

Coatings added over insulation base material such as resin coatings over polyimide are not considered to be part of the insulation and these criteria are not intended to be applicable to those coatings.

Figure 6-19 610D Fig 6-70

Target – Class 1, 2, 3
- Insulation has been trimmed neatly with no signs of pinching, pulling, fraying, discoloration, charring or burning.

Acceptable - Class 1, 2, 3
- A slight, uniform impression in the insulation from the gripping of mechanical strippers.
- Chemical solutions, paste, and creams used to strip solid wires do not cause degradation to the wire.
- Slight discoloration of insulation resulting from thermal processing is permissible, provided it is not charred, cracked or split.

Defect – Class 1, 2, 3
- Any cuts, breaks, cracks or splits in insulation (not shown).
- Insulation is melted into the wire strands (not shown).
- Insulation thickness is reduced by more than 20% (Figures 6-21, 6-22).
- Uneven or ragged pieces of insulation (frays, tails, and tags) are greater than 50% of the insulation outside wire diameter or 1 mm [0.039 in] whichever is more (Figure 6-23).
- Insulation is charred (Figure 6-24).

Figure 6-20 610D Fig 6-71

6.2.2.1 Insulation – Damage – Post-Solder

Figure 6-25 610D Fig 6-76

Target – Class 1, 2, 3
- Insulation is not melted, charred or otherwise damaged from the soldering process.

Acceptable - Class 1, 2, 3
- Slight melting of insulation.

Defect - Class 1, 2, 3
- Insulation charred.
- Solder connection contaminated by burnt or melted insulation.

Figure 6-26 610D Fig 6-77

</table>
6.2.4.1 Insulation - Flexible Sleeve - Placement

**Target – Class 1, 2, 3**
- Insulation sleeving overlaps the connector terminal and extends over the wire insulation four wire diameters (D).
- Insulation sleeving is one wire diameter (D) from the point where the connector terminal enters the connector insert.

**Acceptable – Class 1, 2, 3**
- Insulation sleeving overlaps the connector terminal and the wire insulation by a minimum of two wire diameters.
- Insulation sleeving is more than 50% wire diameter and not more than two wire diameters from the point where the connector terminal enters the connector insert.

**Acceptable – Class 1**
- Sleeving/tubing is tight on terminal, but not tight on wire/cable.

**Acceptable – Class 2, 3**
- Sleeving/tubing is tight on terminal.
- Sleeving/tubing is tight on wire/cable.
- Multiple pieces of sleeving overlap each other by at least 3 cable diameters, or 13 mm [0.5 inch], whichever is larger.

**Defect – Class 1**
- Sleeving/tubing is not tight on terminal and not tight on wire/cable.

**Defect – Class 2, 3**
- Sleeving/tubing is not tight on terminal.
- Sleeving/tubing is not tight on wire/cable.
- Overlap is less than 13 mm [0.5 inch], or less than 3 wire/cable diameters, whichever is less.
Defect – Class 1, 2, 3
• Insulation sleeving is damaged, i.e., split (A), charred (not shown).
• Insulation sleeving overlaps the wire insulation by less than two wire diameters, Figure 6-35A.
• Insulation sleeving is more than two wire diameters from the point where the connector terminal enters the connector insert, Figure 6-35B.
• Insulation sleeve is loose on the terminal (could slide or vibrate off, exposing more than the allowed amount of conductor or terminal), Figure 6-35C.
• Insulation sleeving prevents movement of floating contact in the insert, when movement is required.

Acceptable – Class 1, 2, 3
No damage to insulation sleeving, i.e. splits, char, cracks, tears or pinholes.

Defect – Class 1, 2, 3
• Insulation sleeving is damaged, i.e. splits, char, cracks, tears or pinholes, Figures 6-36, 37.

Acceptable – Class 1
Where strands were straightened during the insulation removal, they have been restored to approximate the original spiral lay of the wire strands.

Acceptable – Class 1
Defect – Class 2, 3
• The general spiral lay of the strands has not been maintained.

Defect – Class 1, 2, 3
• Strands are not flattened, untwisted, buckled, kinked or otherwise deformed.

Acceptable – Class 1, 2, 3
• Where strands were straightened during the insulation removal, they have been restored to approximate the original spiral lay of the wire strands.
• Wire strands are not kinked.
### 6.3.26.9.3 Conductor – Strand Damage

**Target – Class 1, 2, 3**
- Wires strands are not scraped, nicked, cut, flattened, scored, or otherwise damaged.

**Acceptable - Class 1**

**Process Indicator - Class 2, 3**
- Strands cut, broken, scraped or severed if the number of damaged or broken strands in a single wire does not exceed the limits in Table 6-2.

**Defect - Class 1, 2, 3**
- The number of damaged (scraped, nicked or severed) strands in a single wire exceeds the limits in Table 6-2.

#### Table 6-2 Allowable Strand Damage

<table>
<thead>
<tr>
<th>Number of Strands</th>

</table>

**Note 1:** No damaged strands for wires used at a potential for 6 kV or greater.

**Note 2:** For plated wires, a visual anomaly that does not expose basis metal is not considered to be strand damage.

**Note 3:** Damaged strands have nicks or scrapes exceeding 10% of cross sectional area.

### 6.3.36.9.2 Conductor – Strand Separation (Birdcaging) – Presolder

Wire strands disturbed during insulation removal process should be restored to approximate their original lay.

**Target – Class 1, 2, 3**
- Original lay of strands is not disturbed.

**Acceptable – Class 1, 2, 3**
- Wire strands have separation (birdcaging) but do not exceed:
  - One strand diameter.
  - Do not extend beyond wire insulation outside diameter.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

**Figure 6-44 610D Fig 6-85**

**Acceptable – Class 1**
**Process Indicator – Class 2**
**Defect – Class 3**
- Wire strands have separation exceeding one strand diameter but do not extend beyond wire insulation outside diameter.

**Figure 6-45 610D Fig 6-86**

**Acceptable – Class 1**
**Defect – Class 2, 3**
- Wire strands extend beyond wire insulation outside diameter.

**6.3.46.14 Conductor – Damage Strand Separation (Birdcaging) – Post-Solder**

**Target – Class 1, 2, 3**
- No birdcaging.

**Acceptable – Class 1, 2, 3**
- Wire strands have separation (birdcaging), Figure 6-47, but do not exceed the lesser of:
  - One strand diameter.
  - Do not extend beyond wire insulation outside diameter.

**Figure 6-46 610D Fig 6-117**

**Acceptable - Class 1**
**Process Indicator - Class 2**
**Defect - Class 3**
- Wire strands have separation exceeding one strand diameter but do not extend beyond wire insulation outside diameter, Figure 6-46.

**Defect - Class 2, 3**
- Wire strands are birdcaged beyond wire insulation outside diameter, Figure 6-47.

**6.3.56.3 Wire/Lead Preparation Conductor - Tinning**

In this document, the term pretinning and tinning have the same meaning, as defined in IPC-T-50: The application of molten solder to a basis metal in order to increase its solderability.

Tinning of stranded wire has the added benefit of bonding the individual wire strands together, thereby allowing the wire to be formed to terminals or attachment points without separation of the individual strands (birdcaging).

The following criteria are applicable if tinning is required.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

**Target – Class 1, 2, 3**
- Stranded wire is uniformly coated with a thin coat of solder with the individual strands of the wire easily visible.
- Untinned length of strands from end of insulation is not greater than one wire diameter.

**Acceptable – Class 1, 2, 3**
- The solder wets the tinned portion of the wire and penetrates to the inner strands of stranded wire.
- Solder wicks up wire provided the solder does not extend to a portion of the wire that is required to remain flexible.
- The tinning leaves a smooth coating of solder and the outline of the strands are discernible.

**Process Indicator – Class 2, 3**
- Strands are not discernible but excess solder does not affect form, fit or function.
- Solder does not penetrate to the inner strands of the wire.

**Defect – Class 1, 2, 3**
- Pinholes, voids or dewetting/nonwetting exceeds 5% of the area required to be tinned.
- Length of untinned strands from end of insulation is greater than one wire diameter.

Note: IPC/EIA J-STD-002 provides additional information for assessing this requirement.

**Defect – Class 2, 3**
- Pinholes, voids or dewetting/nonwetting exceeds 5% of the area required to be tinned.
- Solder does not wet the tinned portion of the wire.
- Stranded wire is not tinned prior to attachment to terminals or forming splices (other than mesh).

**Defect – Class 1, 2, 3**
- Solder wicking extends into the portion of wire that is required to remain flexible after soldering.
- Solder build-up or icicles within the tinned wire area that affect subsequent assembly steps.
6.4.6 Terminals – Service Loops

Figure 6-51 610D Fig 6-25

Acceptable - Class 1, 2, 3
- Sufficient service loop is provided to allow one field repair to be made.

Figure 6-52 610D Fig 6-26

Acceptable - Class 1
Process Indicator - Class 2
Defect - Class 3
- The wire is too short to allow an additional wrap if repair is necessary.

6.5.6 Terminals - Stress Relief Lead/Wire Bend

6.5.16.6.1 Terminals - Stress Relief Lead/Wire Bend - Bundle

Figure 6-53 610D Fig 6-27

Acceptable - Class 1, 2, 3
- The wire approaches the terminal with a loop or bend sufficient to relieve any tension on the connection during thermal/vibration stress (Figure 6-53).
- The direction of the stress-relief bend places no strain on the mechanical wrap or the solder connection.
- Bend not touching terminal is in conformance with Table 4-1 (Figure 6-54).

Figure 6-54 610D Fig 6-28

Acceptable – Class 1
Process Indicator – Class 2
Defect - Class 3
- Does not meet bend radius requirements. See Table 4-1.

Figure 6-55 610D Fig 6-29

Acceptable - Class 1
Process Indicator - Class 2
Defect - Class 3
- There is insufficient stress relief.
- The wire is under stress at the wrap.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

### 6.5.2 6.6.2 6.4 Terminals - Stress Relief - Lead/Wire Bend

6.6.2 Terminals – Lead/Wire Placement – General Requirements

The terminal wire wrap summarized in Table 6-3 applies equally to wires and component leads. The criteria associated with each terminal type or connection in clauses 6.8 through 6.15 apply only to that connection.

Table 6-3 Terminal Lead/Wire Placement

<table>
<thead>
<tr>
<th>Terminal Type</th>
<th>Class 1</th>
<th>Class 2</th>
<th>Class 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Turret &amp; Straight Pin</td>
<td>&lt;90° Defect</td>
<td>&gt;90° to 180° Process Indicator Defect &lt;180°</td>

<td>&lt;90° Defect</td>
<td>&gt;90° to 180° Process Indicator Defect &lt;180°</td>
<td></td>
</tr>
<tr>
<td>Pierced/Perforated</td>
<td>Makes Contact with Terminal Surface</td>
<td></td>
<td>Defect &lt;90°</td>
</tr>
</tbody>
</table>

Acceptable - Class 1, 2, 3
- Wraps to a terminal are parallel with the terminal base and each other.
- Wires are mounted as close to the terminal base as allowed by the insulation.
- Wrapped conductors do not cross over or overlap each other on terminal.
- Calibration parts may be mounted to the tops of hollow terminals, Figure 6-64.

Acceptable - Class 1, 2
Process Indicator - Class 3
- Wires are not at the base of the terminal, or in contact with the previously installed wire.

Acceptable – Class 1
Defect – Class 2, 3
- Terminal altered to accept oversized wire or wire group.

Process Indicator – Class 2
Acceptable – Class 1
Defect - Class 2, 3
- Wrapped conductors cross over or overlap each other on terminal (not shown).
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

### 6.7.10 Terminals — Solder — General Requirements

Unless otherwise stated for a specific terminal type, the following are general requirements for all terminals:

**Figure 6-67 new**

<table>
<thead>
<tr>
<th>Requirement Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Target — Class 1, 2, 3</strong></td>
<td>100% solder fillet around wire/lead and terminal interface (full extent of wrap).</td>
</tr>
<tr>
<td></td>
<td>Solder wets the wire/lead and terminal and forms a discernible fillet feathering out to a smooth edge.</td>
</tr>
<tr>
<td></td>
<td>Wire/lead is clearly discernible in the solder connection.</td>
</tr>
</tbody>
</table>

**Acceptable - Class 1, 2, 3**

- Solder fillet at least 75% of the circumference of the wire/lead and terminal interface.
- Height of solder is greater than 75% of wire diameter in the wire to post contact area.

**Acceptable - Class 1**

**Process Indicator — Class 2, 3**

- Wire/lead not discernible in solder connection.

**Defect — Class 1, 2**

- Depression of solder between the post and the wrap of the wire is greater than 50% of wire/lead radius (Figure 6-67).

**Defect — Class 3**

- Depression of solder between the post and the wrap of the wire is greater than 25% of wire/lead radius.

**Defect — Class 1, 2, 3**

- Solder fillet is less than 75% of the circumference of the wire/lead and terminal interface.

### 6.8 Terminals — Turrets and Straight Pins — Lead/Wire Placement — Turrets and Straight Pins

**Table 6-4** is applicable to leads and wires attached to turret and straight pin terminals.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

### TABLE 6-4 Turret or Straight Pin Terminal Lead/Wire Placement

<table>
<thead>
<tr>
<th>Criteria</th>
<th>Class 1</th>
<th>Class 2</th>
<th>Class 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;90° contact between the lead/wire and terminal post</td>

<td></td>
<td></td>
</tr>
<tr>
<td>90° to &lt;180° contact between the lead/wire and terminal post</td>
<td>Accept</td>
<td>Process Indicator</td>
<td>Defect</td>
</tr>
<tr>
<td>≥180° Contact between lead/wire and post</td>
<td>Accept</td>
<td></td>
<td></td>
</tr>
<tr>
<td>&gt;360° and overlaps itself, Note 1</td>
<td>Accept</td>
<td></td>
<td>Defect</td>
</tr>
<tr>
<td>Wire violates minimum electrical clearance</td>
<td></td>
<td></td>
<td>Defect</td>
</tr>
</tbody>
</table>

**Note 1:** A wire that is wrapped more than 360° and remains in contact with the terminal post is considered an overwrap or spiral wrap, Figure 6-64A. A wire/lead that is wrapped more than 360° and crosses over itself, i.e., does not remain in contact with the terminal post, is considered an overlap, Figure 6-64B.

**Note 2:** See 6.14 for criteria AWG 30 and smaller wires.

---

**Figure 6-69 610D Fig 6-36**

Target – Class 1, 2, 3
- Wraps parallel to each other and to the base.
- Wire mounted against terminal base or previously installed wire.
- On straight pins, the top wire on terminal is one wire diameter below the top of the terminal.
- Wraps are a minimum of 180° and a maximum of 270°.
- Wires and leads mechanically secure to terminals before soldering.

Acceptable – Class 1, 2, 3
- Wires and leads wrapped a minimum of 180° and do not overlap.

---

**Figure 6-70 610D Fig 6-37**

Acceptable – Class 1

Process Indicator – Class 2

Defect – Class 2, 3
- Wire end overlaps itself.

---

**Figure 6-71 new**

Process Indicator – Class 2
- Wrap for round posts 90° to less than 180° of contact between the wires and the terminal.

Defect – Class 1, 2
- Wrap for round posts has less than 90° of contact between the wires and the terminal.

Defect – Class 1, 2, 3
- Long wire end violates minimum electrical clearance.

Defect – Class 3
- Wrap for round posts has less than 180° of contact between the wires and the terminal.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

| 6.8.26.10.12 Terminals - Solder – Turret and Straight Pin - Solder |

**Figure 6-72 610D Fig 6-90**

**Target – Class 1, 2, 3**
- Lead outline is discernible, smooth flow of solder on wire and terminal.
- Solder fillets at all points of wire/lead and terminal interface.

**Acceptable – Class 1, 2, 3**
- Solder is wetted to at least 75% of the contact area between the wire/lead and terminal interface for leads wrapped 180° or more.
- Solder is wetted to 100% of the contact area between the wire/lead and terminal interface for leads wrapped less than 180°.
- Height of solder is greater than 75% of wire diameter in the wire to post contact area.

**Acceptable – Class 1, 2**
- Solder is wetted to 100% of contact areas between the wire/lead and terminal interface for leads wrapped between 90° and 180°.

**Acceptable – Class 1 Process Indicator – Class 2, 3**
- Wire/lead not discernible in solder connection.

**Defect – Class 1, 2**
- Solder is wetted less than 100% of the lead to terminal contact area when the wrap is more than 90° and less than 180°.
- Depression of solder between the post and the wrap of the wire is greater than 50% of wire radius.

**Defect – Class 3**
- Depression of solder between the post and the wrap of the wire is greater than 25% of wire radius.

**Figure 6-73 610D Fig 6-91**

**Defect - Class 1, 2, 3**
- Poor wetting.
- Less than 100% fillet of the lead to terminal contact when the wrap is less than 180°.
- Less than 75% fillet of the lead to terminal contact when the wrap is 180° or more.

**Figure 6-74 610D Fig 6-92**
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

**6.9 Terminals – Bifurcated**

**6.9.16.7.2.1 Terminals – Bifurcated – Lead/Wire Placement – Bifurcated – Side Route Attachments**

Table 6-5 is applicable to leads and wires attached to side-route bifurcated terminals.

<table>
<thead>
<tr>
<th>TABLE 6-5 Bifurcated Terminal Lead/Wire Placement – Side Route</th>
</tr>
</thead>
<tbody>
<tr>
<td>Criteria</td>
</tr>
<tr>
<td>&lt;90° wrap</td>
</tr>
<tr>
<td>≥ 90° wrap</td>
</tr>
<tr>
<td>&gt;360° and wire end overlaps itself</td>
</tr>
<tr>
<td>Violates Minimum Electrical Clearance</td>
</tr>
</tbody>
</table>

**Figure 6-75 610D Fig 6-39**

**Target – Class 1, 2, 3**
- The wire or lead contacts two parallel faces (180° bend) of the terminal post.
- The cut end of the wire contacts the terminal.
- No overlapping of wraps.
- Wires placed in ascending order with largest on the bottom.
- Multiple wire attachments alternate terminal posts.

**Figure 6-76 610D Fig 6-40**

**Acceptable - Class 1, 2, 3**
- Wire end extends beyond the base of the terminal provided minimum electrical spacing is maintained.
- Wire passes through the slot and makes positive contact with at least one corner of the post.
- No portion of the wrap extends beyond the top of the terminal post.
- If required, wire wrap is at least 90°.

**Acceptable - Class 1, 2**
- Wires/leads 0.75 mm [0.0295 in] or larger in diameter are routed straight through the posts.

**Note:** 0.75 mm is approximately equal to 22 AWG stranded wire.

**Acceptable – Class 3**
- Wires/leads 0.75 mm [0.0295 in] or larger in diameter are routed straight through the posts and staked, see 6.9.3.
Acceptable - Class 1
Process Indicator - Class 2
Defect - Class 3

- Any portion of the wrap extends beyond the top of terminal post.
- Wire/lead <less than> 0.75 mm [0.0295 in] in diameter is wrapped around a post less than 90º.

Acceptable - Class 1
Defect - Class 2, 3
- Wire end overlaps itself.

Defect – Class 3
- Wire/lead ≥equal to or greater than 0.75 mm [0.0295 in] in diameter is wrapped less than 90º and is not staked, see 6.9.3.

Defect - Class 1, 2, 3
- Wire does not pass through slot.
- Wire end violates minimum electrical clearance, see Figure 6-77.

Table 6-6 is applicable to leads and wires attached to bottom-route bifurcated terminals.

<table>
<thead>
<tr>
<th>Criteria</th>
<th>Class 1</th>
<th>Class 2</th>
<th>Class 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;90º wrap</td>
<td>Accept</td>
<td>Process Indicator</td>
<td>Defect</td>
</tr>
<tr>
<td>90º to 180º wrap</td>
<td>Accept</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Target – Class 1, 2, 3
- Wire insulation does not enter base or posts of terminal.
- Bottom route wire wrap contacts two parallel sides of post (180 º).
- Wire is against base of terminal.
- Top route wire has space between posts filled by using separate filler or bending the wire double (Figure 6-79 B, C).

Acceptable - Class 1
Process Indicator - Class 2
Defect - Class 3
- Wire insulation enters base or posts of terminal.
- Top route wire is not supported with filler.
- Bottom route wire not wrapped to terminal base or post with a minimum 90º bend.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

### 6.9.3 6.7.3 Terminals – Bifurcated - Lead/Wire Placement– - Staked Wires

As an alternative to wrap requirements of 6.9.1 or 6.11, the following criteria (summarized in Table 6-7) apply to wires/leads/components that are staked, bonded or otherwise constrained to provide support for the solder connection.

#### Table 6-7 Staking Requirements of Side Route Straight Through Connections - Bifurcated Terminals

<table>
<thead>
<tr>
<th>Wire Diameter</th>
<th>Class 1</th>
<th>Class 2</th>
<th>Class 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;0.75 mm [0.0295 in]¹</td>
<td>Defect if not staked</td>
<td>Defect if not staked</td>
<td>Defect if not staked</td>
</tr>
<tr>
<td>≥0.75 mm [0.0295 in]²</td>
<td>Acceptable if not staked</td>
<td>Process Indicator if not staked</td>
<td>Defect if not staked</td>
</tr>
</tbody>
</table>

1. AWG-2022 and smaller
2/ AWG-2220 and larger

**Figure 6-82 610D Fig 6-46**

Target – Class 1, 2, 3
- Wire is permanently staked or constrained by a permanent mounting device.
- Wire contacts base of terminal or the previous wire.
- Wire extends through posts of bifurcated terminal.
  - Wire extends beyond the eye of pierced/perforated terminals.
  - Wire contacts two sides of pierced/perforated terminals.

Acceptable – Class 1
Process Indicator Class 2
- Wires or leads equal to or greater than 0.75 mm [0.0295 in] and wrapped less than 90º are not staked.

Defect – Class 1, 2
- Wires or leads less than 0.75 mm [0.0295 in] and wrapped less than 90º are not staked.

**Figure 6-83 610D Fig 6-47**

Defect – Class 3
- Any straight through wire is not staked.

Defect – Class 1, 2, 3
- When required, the wire is not staked or component body not bonded to board or adjacent surface or retained by a mounting device.

### 6.9.4 6.10.2 Terminals – Bifurcated - Solder – Bifurcated

**Figure 6-84 610D Fig 6-93**

Target – Class 1, 2, 3
- Lead outline is discernible; smooth flow of solder on wire and terminal.
- Solder fillets at all points of wire/lead and terminal interface.

**Figure 6-85 610D Fig 6-94**
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

**Figure 6-86 610D Fig 6-95**

**Acceptable** - Class 1, 2, 3
- Solder is wetted to at least 75% of the contact area between the wire/lead and terminal interface for leads wrapped 180° or more.
- Solder is wetted to 100% of the contact area between the wire/lead and terminal interface for leads wrapped less than 180°.
- Solder is 75% of the height of the terminal post for top-route wires.

**Defect** - Class 1, 2, 3
- Depression of solder between the post and the wire is greater than 50% of wire radius.
- Solder is less than 75% of the height of the terminal post for top-route wires.
- Less than 100% fillet of the lead to terminal contact when the wrap is less than 180° (not shown).
- Less than 75% fillet of the lead to terminal contact when the wrap is 180° or more (not shown).

**Defect** - Class 1, 2, 3
- Depression of solder between the post and the wire is greater than 25% of wire radius.

**Figure 6-87 610D Fig 6-96**

**Acceptable** - Class 1
**Process Indicator** - Class 2, 3
- Wire/lead not discernible in solder connection.

**Figure 6-88**

**Defect** - Class 1, 2
- Depression of solder between the post and the wire is greater than 50% of wire radius.

**Defect** - Class 1, 2, 3
- Depression of solder between the post and the wire is greater than 25% of wire radius.

6.10.1 Terminals - Slotted – Lead/Wire Placement

**Target** – Class 1, 2, 3
- Lead or wire extends completely through slot and is discernible on the exit side.
- Wire is in contact with base of terminal area or previously installed wire.

**Acceptable** – Class 1, 2, 3
- Lead or wire end is discernible on the exit side of terminal.
- No portion of the wire termination extends above the top of the terminal post.

**Note:** Wrap is not required on a slotted terminal.

6-24
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

Figure 6-92 new

Acceptable - Class 1
Process Indicator - Class 2
Defect - Class 3
• Lead end not discernible on exit side of terminal.
• Wire termination extends above the top of the terminal post.

Defect – Class 1, 2, 3
• Wire end violates minimum electrical clearance.

6.10.2 6.10.3 Terminals - Slotted - Solder — Slotted

Solder should form a fillet with that portion of the lead or wire that is in contact with the terminal. Solder may completely fill the slot but should not be built up on top of the terminal. The lead or wire should be discernible in the terminal.

Figure 6-93 610D Fig 6-99

Target – Class 1, 2, 3
• Solder forms a fillet with that portion of the lead or wire that is in contact with the terminal.
• There is visible insulation clearance.

Figure 6-94 610D Fig 6-100

Acceptable – Class 1, 2, 3
• Solder fills terminal slot.
• Lead or wire end is discernible in the solder on the exit side of terminal.

Figure 6-95 610D Fig 6-101

Defect – Class 1, 2, 3
• Wire or lead end is not discernible.
• Fillet not formed with 100% of the portion of the wire that is in contact with the terminal (not shown).

6.11 Terminals – Pierced/Perforated

6.11.6.7.5 Terminals - Pierced/Perforated – Lead/Wire Placement – Pierced/Perforated

Table 6-8 is applicable to leads and wires attached to pierced or perforated terminals.

<table>
<thead>
<tr>
<th>TABLE 6-8 Pierced or Perforated Terminal Lead/Wire Placement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Criteria</td>
</tr>
<tr>
<td>&lt;90° wrap</td>
</tr>
<tr>
<td>≥90° wrap</td>
</tr>
<tr>
<td>Wire end overlaps itself</td>
</tr>
<tr>
<td>Wire does not pass through the eye and contact two sides of the terminal</td>
</tr>
<tr>
<td>Wire end violated minimum electrical clearance</td>
</tr>
</tbody>
</table>

6- 25
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

Figure 6-96 610D Fig 6-51

**Target – Class 1, 2, 3**
- Wire passes through the eye of the terminal.
- Wire wrapped to contact two nonadjacent sides of the terminal.

Figure 6-97 610D Fig 6-52

**Acceptable Class** 2, 3
- Wire wrap equal to or greater than 90° or wire contacts both sides of the terminal.

Figure 6-98 new

**Acceptable - Class 1**
**Defect - Class 2, 3**
- Wire wrap less than 90° and/or wire does not contact two nonadjacent sides of the terminal.
- Wire does not pass through the eye of the terminal.

Figure 6-99 610D Fig 6-53

**Acceptable - Class 1**
**Process Indicator Defect - Class 2, 3**
- Wire end overlaps itself.

**Defect – Class 2, 3**
- Terminal altered to accept oversize wire or wire group.
- Strands not in conformance with Table 6.1.1, 2, 3

**Defect - Class 1, 2, 3**
- Wire end violates minimum electrical clearance to noncommon conductor (not shown).

Figure 6-100 610D Fig 6-102

**Target – Class 1, 2, 3**
- Lead outline is discernible; smooth flow of solder on wire and terminal.
- Solder fillets at all points of wire/lead and terminal interface.

Figure 6-101 610D Fig 6-103

**Acceptable - Class 1, 2, 3**
- Solder fillet joins the wire to the terminal for at least 75% of the wire and terminal interface for wraps of 180° or more.
- Solder fillet joins the wire to the terminal for 100% of the wire and terminal interface for wraps <less than> 180°.

Figure 6-102 610D Fig 6-104

**Acceptable – Class 1**
**Process Indicator – Class 2, 3**
- Wire/lead not discernible in solder connection.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

### Defect – Class 1, 2
- Depression of solder between the post and the wrap of the wire is greater than 50% of wire radius.

### Defect - Class 1, 2, 3
- Solder dewetted from terminal.
- Solder contact angle greater than 90°.
- Less than 100% fillet of the lead to terminal contact when the wrap is less than 180°.
- Less than 75% fillet of the lead to terminal contact when the wrap is 180° or more.

### Defect – Class 3
- Depression of solder between the post and the wrap of the wire is greater than 25% of wire radius.

---

#### 6.12 Terminals – Hook

#### 6.12.16.7.6 Terminals - Hook – Lead/Wire Placement – Hook

Table 6-9 is applicable to leads and wires attached to hook terminals.

<table>
<thead>
<tr>
<th>TABLE 6-9 Hook Terminal Lead/Wire Placement</th>

</tr>
</tbody>
</table>

---

Figure 6-103 610D Fig 6-105

Target Class 1, 2, 3
- Wire wrap contacts terminal for a minimum of 180°.
- Minimum of one wire diameter space from end of hook to the closest wire.
- Wires attached within the 180° arc of the hook.
- Wires do not overlap.

---

6-27
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

Figure 6-105 610D Fig 6-55

Acceptable - Class 1, 2, 3
- Wire contacts and wraps terminal at least 180°.
- **No overlap of wire turns.**
- Minimum of one wire diameter space from end of hook to the closest wire.

Process Indicator
Defect - Class 2, 3
- Wire end overlaps itself.

Figure 6-106 610D Fig 6-56

Acceptable - Class 1
Process Indicator - Class 2
Defect - Class 3
- Wire is wrapped less than one wire diameter from end of hook.
- Wire wrap is less than 180°.
- Wire is attached outside the arc of the hook and less than two lead wire diameters or 1 mm [0.039 in], whichever is greater, from the base of the terminal.
- Wire wrap is less than 180°.

Defect – Class 1, 2
- Wire wrap is less than 90°.

Acceptable - Class 1
Defect - Class 2, 3
- Wire end overlaps itself.

Defect - Class 1, 2, 3
- Wire end violates minimum electrical clearance to noncommon conductor.

6.12.6.10.5 Terminals - Hook - Solder - Hook/Pin

Figure 6-107 610D-6-108

Target – Class 1, 2, 3
- Lead outline is discernible; smooth flow of solder on wire and terminal.
- Solder fillets at all points of wire/lead and terminal interface.

Figure 6-108 610D Fig 6-107

Acceptable - Class 1, 2, 3
- Solder is wetted to at least 75% of the contact area between the wire/lead and terminal interface for leads wrapped 180° or more.
- Solder is wetted to 100% of the contact area between the wire/lead and terminal interface for leads wrapped less than 180°.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

### Acceptable – Class 1
### Process Indicator – Class 2, 3
- Wire/lead not discernible in solder connection.

### Defect – Class 1, 2
- Depression of solder between the post and the wrap of the wire is greater than 50% of wire radius.

### Defect – Class 3
- Depression of solder between the post and the wrap of the wire is greater than 25% of wire radius.

</table>
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

Acceptable – Class 1
Defect - Class 2, 3
- Solder cup altered to accept oversized wire or wire group.

Defect - Class 1, 2, 3
- Strands not in conformance with 6.3.2.
- Wires not in contact with back wall interfere with subsequent assembly steps.

| 6.13.2 6.10.6 Terminals - Solder Cups - Solder – Solder Cups |

These criteria are applicable to either solid or stranded wire, single or multiple wires.

Figure 6-113 610D Fig 6-110

Target – Class 1, 2, 3
- Solder wets the entire inside of the cup.
- Solder fill is 100%.

Figure 6-114 610D Fig 6-111

Acceptable - Class 1, 2, 3
- Thin film of solder on the outside of the cup.
- Solder fill 75% or more.
- Solder buildup on the outside of the cup, as long as it does not affect form, fit or function.
  - Solder visible in or slightly protrudes from the inspection hole (if one is provided).

Figure 6-115 610D Fig 6-112

Figure 6-116 New

Figure 6-117 610D Fig 6-113

Defect - Class 1, 2, 3
- Solder vertical fill less than 75%.
- Solder buildup on outside of the cup negatively affects form, fit or function.
  - Solder not visible in the inspection hole (if one is provided).

Figure 6-118 610D Fig 6-114

Defect - Class 1, 2
- Depression of solder between the cup and the wire is greater than 50% of wire radius.

Figure 6-119 new 610e-6-118

Defect – Class 3
- Depression of solder between the cup and the wire is greater than 25% of wire radius.
6.14 Terminals – AWG 30 and Smaller Diameter Wires

**Target – Class 1, 2, 3**
- Wire has two wraps (720°) around terminal post.
- Wire does not overlap or cross over itself or other wires terminated on the terminal.

**Acceptable - Class 1, 2, 3**
- Wire has more than one 360° wrap but less than three.

**Acceptable – Class 1**

**Defect - Class 2**
- Wire has less than 180° wrap.

**Process Indicator - Class 2**

**Defect - Class 3**
- Wire has less than one 360° wrap around terminal.

6.15 Terminals – Lead/Wire Placement—Series Connected

**These criteria apply** when three or more terminals are connected by a common bus wire, the end terminals need to meet the required wrap for individual terminals.

**Target – Class 1, 2, 3**
- Stress relief radii between each terminal.
- Turrets - Wire contacts base of terminal or a previously installed wire, and wraps around or interweaves each terminal.
- Hooks - Wire wraps 360° around each terminal.
- Bifurcated - Wire passes between posts and contacts base of terminal or previously installed wire.
- Pierced/Perforated - Wire contacts two nonadjacent sides of each terminal.
- **The connection to the first and last terminals meets the required wrap for individual terminals.**
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

**Acceptable - Class 1**

**Process Indicator - Class 2**

**Defect - Class 3**

- Turrets - Wire does not wrap 360° around each inner terminal or is not interwoven between terminals.
- Hooks - Wire wraps less than 360° around inner terminal.
- Bifurcated - Wire does not pass between the posts or is not in contact with the terminal base or a previously installed wire.
- Pierced/Perforated - Wire does not contact two nonadjacent sides of each inner terminal.

**Defect - Class 1, 2, 3**

- No stress relief between any two terminals.
- The connection to the first and last terminals does not meet the required wrap for individual terminals.

</table>
7 Through Hole Technology

This section includes hardware, adhesive, forming, mounting, termination and soldering criteria for through-hole installation.

The placement of any component on the electronic assembly does not prevent the insertion or removal of any hardware (tool clearance included) used to mount the assembly.

Minimum spacing between installed hardware and the conducting land, component leads or uninsulated components depends on specified voltage and is not less than the specified minimum electrical clearance, see 1.5.3.

Bonding material is sufficient to hold the part but does not encapsulate and cover component identification.

Visual inspection includes part identification and polarity, assembly sequence, and damage to hardware, component, or board.

In addition to the criteria in this section the criteria of Section 5 are applicable. Solder connections must meet the criteria of Section 5.

The following topics are addressed in this section:

7.1 Component Mounting
  7.1.1 Orientation
  7.1.1.1 Horizontal
  7.1.1.2 Vertical
  7.1.2 Lead Forming
  7.1.2.1 Bends
  7.1.2.2 Stress Relief
  7.1.2.3 Damage
  7.1.3 Leads Crossing Conductors
  7.1.4 Hole Obstruction
  7.1.5 DIP/SIP Devices and Sockets
  7.1.6 Radial Leads – Vertical
  7.1.6.1 Spacers
  7.1.7 Radial Leads - Horizontal
  7.1.8 Connectors
  7.1.8.1 Right Angle
  7.1.8.2 Vertical Shrouded Pin Headers and Vertical Receptacle Connectors
  7.1.9 High Power
  7.1.10 Conductive Cases

7.2 Component Securing
  7.2.1 Mounting Clips
  7.2.2 Adhesive Bonding
  7.2.2.1 Adhesive Bonding - Non-Elevated Components
  7.2.2.2 Adhesive Bonding - Elevated Components
  7.2.3 Wire Hold Down

7.3 Supported Holes
  7.3.1 Axial Leaded – Horizontal
  7.3.2 Axial Leaded – Vertical
  7.3.3 Wire/Lead Protrusion
  7.3.4 Wire/Lead Clinches
  7.3.5 Solder
  7.3.5.1 Vertical fill (A)
  7.3.5.2 Primary Side - Lead to Barrel (B)
  7.3.5.3 Primary Side - Land Area Coverage (C)
  7.3.5.4 Secondary Side - Lead to Barrel (D)
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

7.3.5.5 Secondary Side - Land Area Coverage (E)
7.3.5.6 Solder Conditions - Solder in Lead Bend
7.3.5.7 Solder Conditions – Touching Through-Hole Component Body
7.3.5.8 Solder Conditions - Meniscus in Solder
7.3.5.9 Lead Cutting after Soldering
7.3.5.10 Coated Wire Insulation in Solder
7.3.5.11 Interfacial Connection without Lead - Vias
7.3.5.12 Board in Board

7.4 Unsupported Holes
7.4.1 Axial Leads - Horizontal
7.4.2 Axial Leads - Vertical
7.4.3 Wire/Lead Protrusion
7.4.4 Wire/Lead Clinches
7.4.5 Solder
7.4.6 Lead Cutting after Soldering

7.5 Jumper Wires
7.5.1 Wire Selection
7.5.2 Wire Routing
7.5.3 Wire Staking
7.5.4 Supported Holes
7.5.4.1 Lead in Hole
7.5.5 Wrapped Attachment
7.5.6 Lap Soldered

7.1 Component Mounting

7.1.1 Component Mounting - Orientation

This section covers acceptability requirements for the installation, location, and orientation of components and wires mounted onto printed boards.

Criteria are given for only the actual mounting or placement of components or wires on electronic assemblies and to standoff terminals. Solder is mentioned where it is an integral part of the placement dimensions, but only as related to those dimensions.

Inspection usually starts with a general overall view of the electronic assembly, then follows each component/wire to its connection, concentrating on the lead into the connection, the connection and the tail end of the lead/wire leaving the connection. The wire/lead protrusion step for all lands should be saved for last so that the board can be flipped over and all connections checked together.

7.1.1.1 Component Mounting - Orientation - Horizontal

Additional criteria for horizontal mounting of axial leaded components are provided in clauses 7.3.1 (supported holes) and 7.4.1 (unsupported holes).

Target - Class 1, 2, 3
- Components are centered between their lands.
- Component markings are discernible.
- Nonpolarized components are oriented so that markings all read the same way (left-to-right or top-to-bottom).
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

**Figure 7-2 610D-07-002**

<table>
<thead>
<tr>
<th>Acceptable - Class 1, 2, 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Polarized and multilead components are oriented correctly.</td>
</tr>
<tr>
<td>• When hand formed and hand-inserted, polarization symbols are discernible.</td>
</tr>
<tr>
<td>• All components are as specified and terminate to correct lands.</td>
</tr>
<tr>
<td>• Nonpolarized components are not oriented so that markings all read the same way (left-to-right or top-to-bottom).</td>
</tr>
</tbody>
</table>

**Figure 7-3 updated**

<table>

</tr>
<tr>
<td>• Component not mounted in correct holes (B).</td>
</tr>
<tr>
<td>• Polarized component mounted backwards (C).</td>
</tr>
<tr>
<td>• Multileaded component not oriented correctly (D).</td>
</tr>
</tbody>
</table>

### 7.1.1.2 Component Mounting - Orientation - Vertical

Additional criteria for vertical mounting of axial leaded components are provided in clauses 7.3.2 (supported holes) and 7.4.2 (unsupported holes).

In the examples in Figures 7-4 through 7-6, the arrows printed on the black capacitor casing are pointing to the negative end of the component.

**Figure 7-4 610D-7-04**

<table>
<thead>
<tr>
<th>Target - Class 1, 2, 3</th>

</tr>
</tbody>
</table>
7.1.2 Component Mounting - Lead Forming

7.1.2.1 Component Mounting - Lead Forming - Bends

Figure 7-7 610D Fig 7-7

Acceptable – Class 1, 2, 3
- The inside bend radius of component leads meets requirements of Table 7-1.

Table 7-1 Lead Bend Radius

<table>
<thead>
<tr>
<th>Lead Diameter (D) or Thickness (T)</th>
<th>Minimum Inside Bend Radius (R)</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt; 0.8 mm [0.031 in]</td>
<td>1 D/T</td>
</tr>
<tr>
<td>0.8 mm [0.031 in] to 1.2 mm [0.0472 in]</td>
<td>1.5 D/T</td>
</tr>
<tr>
<td>≥1.2 mm [0.0472 in]</td>
<td>2 D/T</td>
</tr>
</tbody>
</table>

Note: Rectangular leads use thickness (T).

Acceptable – Class 1
Process Indicator – Class 2
Defect - Class 3
- Inside bend radius does not meet requirements of Table 7-1.

Figure 7-8 610D Fig 7-9

Defect – Class 1, 2, 3
- Lead is kinked.

Figure 7-9 610D Fig 7-10

Acceptable – Class 1, 2, 3
- Leads far of through-hole mounting extend at least 1 lead diameter or thickness but not less than 0.8 mm [0.031 in] from the body, solder bead, or lead weld.

- Lead is not kinked or cracked.
- The minimum inside bend radius of component leads meets requirements of Table 7-1.

Figure 7-10 610D Fig 7-8

Acceptable - Class 1
Process Indicator - Class 2
Defect - Class 3
- Lead bend of through-hole mounted component is less than 1 lead diameter or 0.8 mm [0.031 in], whichever is less, from the component body, solder bead or component body lead seal.

Figure 7-11 NEW

Acceptable - Class 1
Process Indicator - Class 2
Defect - Class 3
- Lead bend of through-hole mounted component is less than 1 lead diameter or 0.8 mm [0.031 in], whichever is less, from the component body, solder bead or component body lead seal.

Figure 7-12 610D Fig 7-11

Defect - Class 1, 2, 3
- Fractured lead weld, solder bead, or component body lead seal.
- Lead damage exceeds limits of 7.1.2.3.
Components are mounted in any 1 or a combination of the following configurations:

- In a conventional manner utilizing 90° (nominal) lead bends directly to the mounting hole.
- With camel hump bends. Configuration incorporating a single camel hump may have the body positioned off-center.
- Other configurations may be used with agreement of the customer or where design constraints exist.

Loop bends may be used if the location of the mounting holes prevents the use of a standard bend and if there is no possibility of shorting the lead to any adjacent component lead or conductor. Use of loop bends may impact circuit impedance, etc., and shall be approved by design engineering.

Prepped components with stress bends as shown in Figure 7-13 usually cannot meet the maximum spacing requirements of a straight-legged vertical - radial leaded component, see 7.1.6. Maximum space between component and board surface is determined by design limitations and product use environments. The component preparation equipment and manufacturer's suggested component lead bend specifications and capabilities determine limitation. This may require change in tooling to meet requirements for end use.

**Figure 7-13 610D Fig 7-012**

1. Typically 4 – 8 wire diameters
2. 1 wire diameter minimum
3. 2 wire diameter minimum

**Acceptable Class 1, 2, 3**

- Leads are formed to provide stress relief.
- Component lead exiting component body is approximately parallel to major body axis.
- Component lead entering hole is approximately perpendicular to board surface.
- Component centering may be offset as a result of the type of stress relief bend.

**Figure 7-14 610D Fig 7-013**

**Acceptable - Class 1**

**Process Indicator - Class 2**

**Defect - Class 3**

- Lead bends less than 1 lead diameter away from body seal.

**Figure 7-15 610D Fig 7-014**

**Defect - Class 1, 2, 3**

- Damage or fracture of component body-to-lead seal.
- No stress relief.

**Figure 7-16 610D-7-15**

**7.1.2.3 Component Mounting - Lead Forming - Damage**

These criteria are applicable whether leads are formed manually or by machine or die.

**Figure 7-17 610D Fig 7-016**

**Acceptable - Class 1, 2, 3**

- Component leads do not have nicks or deformation exceeding 10% of the diameter, width or thickness of the lead. See 5.2.1 for exposed basis metal criteria.

**Figure 7-18 New**

**Defect - Class 1, 2, 3**

- Lead is damaged more than 10% of the lead diameter or thickness.
- Lead deformed from repeated or careless bending.

**Figure 7-19 610D Fig 7-018**

**Defect - Class 1, 2, 3**

- Heavy indentations such as serrated pliers mark.
7.1.3 Component Mounting - Leads Crossing Conductors

Sleeving must be used when called for by specification or drawing.

**Figure 7-20 610D Fig 7-019**

<table>
<thead>
<tr>
<th>Acceptable - Class 1, 2, 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sleeve does not interfere with formation of the required solder connection (A).</td>
</tr>
<tr>
<td>Sleeve covers area of protection designated (B).</td>
</tr>
</tbody>
</table>

**Acceptable – Class 1**

Unsleeved component lead crossing an electrically noncommon conductor that does not violate electrical spacing (B).

**Defect - Class 2, 3**

- Splitting and/or unraveling of sleeving (A).
- A component lead crossing an electrically noncommon conductor with a clearance of less than 0.5 mm [0.020 in] with no separating insulator (lead sleeving or surface coating) (B).

**Defect - Class 1, 2, 3**

- Component leads and wires specified required to have sleeving are not sleeved.
- Damaged/insufficient sleeving dies not no longer provide protection from shorting.
- Sleeving interferes with formation of the required solder connection.
- A component lead crossing an electrically noncommon conductor violates minimum electrical clearance (B).

7.1.4 Component Mounting - Hole Obstruction

**Figure 7-22 610D Fig 7-021**

1. Insulating washer
2. Spacer

**Acceptable - Class 1, 2, 3**

- Parts and components are mounted such that they do not obstruct solder flow onto the primary side (solder destination side) lands of plated-through holes required to be soldered.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

**Process Indicator - Class 2**

**Defect - Class 3**
- Parts and components obstruct solder flow onto the primary side (solder destination side) lands of plated-through holes required to be soldered.

**Defect Class 1, 2, 3**
- Parts and components are mounted such that they violate minimum electrical clearance.

**7.1.5 Component Mounting – DIP/SIP Devices and Sockets**

These criteria are applicable to Dual-in-Line Packages (DIP), Single-in-Line Packages (SIP) and sockets.

**Note:** In some cases a heat sink may be located between the component and the printed board; in these cases other criteria may be specified.

**Target - Class 1, 2, 3**
- Standoff step on all leads rests on the land.
- Lead protrusion meets requirements, see 7.3.3 and 7.4.3.

**Acceptable - Class 1, 2, 3**
- Amount of tilt is limited by minimum lead protrusion and height requirements.

**Defect - Class 1, 2, 3**
- Tilt of the component exceeds maximum component height limits.
- Lead protrusion does not meet acceptance requirements due to tilt of component.
7.1.6 Component Mounting - Radial Leads – Vertical

Target - Class 1, 2, 3
- Component is perpendicular and base is parallel to board.
- Clearance between base of component and board surface/land is between 0.3 mm [0.012 in] and 2 mm [0.079 in].

Acceptable - Class 1, 2, 3
- Component tilt does not violate minimum electrical clearance.

Process Indicator - Class 2, 3
- Space between component base and board surface/land is less than 0.3 mm [0.012 in] or more than 2 mm [0.079 in], see 7.1.4.

Defect - Class 1, 2, 3
- Violates minimum electrical clearance.

Note: Some components cannot be tilted due to mating requirements with enclosures or panels, for example toggle switches, potentiometers, LCDs, and LEDs.

7.1.6.1 Component Mounting - Radial Leads – Vertical - Spacers

Spacers used for mechanical support or to compensate for component weight need to be in full contact with both component and board surface.

Target - Class 1, 2, 3
- Spacer is in full contact with both component and board.
- Lead is properly formed.

Acceptable (Supported Holes) - Class 1, 2

Process Indicator (Supported Holes) - Class 3

Defect (Unsupported Holes) - Class 1, 2, 3
- Spacer is not in partial/full contact with component and board.
- Edges of spacer contact both component and board.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

Acceptable (Supported Holes) - Class 1
Process Indicator (Supported Holes) - Class 2
Defect (Supported Holes) - Class 3
Defect (Unsupported Holes) – Class 1, 2, 3

• Spacer is not in contact with component and board; Figures 7-38 (A), 7-39.
• Lead is improperly formed; Figure 7-37 (B).

Defect - Class 2, 3
• Spacer is inverted; Figure 7-38 (C).
• Required spacer is missing.

7.1.7 Component Mounting - Radial Leads - Horizontal

Figure 7-40 610D Fig 7-039

Target - Class 1, 2, 3
• The component body is in flat contact with the board's surface.
• Bonding material is present, if required. See 7.2.2.

Figure 7-41 610D Fig 7-040

Acceptable - Class 1, 2, 3
• Component in contact with board on at least 1 side and/or surface.

Note: When documented on an approved assembly drawing, a component may be either side mounted or end mounted. The side or surface of the body, or at least one point of any irregularly configured component (such as certain pocketbook capacitors), needs to be in full contact with the printed board. The body may need to be bonded or otherwise secured to the board to prevent damage when vibration and shock forces are applied.

Figure 7-42 610D Fig 7-041

Defect - Class 1, 2, 3
• Unbonded component body not in contact with mounting surface.
• Bonding material not present if required.
7.1.8 Component Mounting - Connectors

These criteria apply to soldered connectors, and unsoldered press fit connectors. For connector pin criteria see 4.3. For connector damage criteria see 9.5.

Connector module/pin misalignment, defined in this section, is to be measured at the connector lead-in area/hole (for receptacles) or at the pin tip (for pin headers).

In cases where an assembly connector is composed of two or more identical connector modules, modules manufactured by different suppliers shall not be mixed.

**Figure 7-43 new**

**Target - Class 1, 2, 3**
- Connector is flush with board.
- Lead protrusion meets requirements.
- Board lock (if equipped) is fully inserted/snapped into the board.

**Figure 7-44 610D Fig 7-042**

**Acceptable - Class 1, 2, 3**
- Back edge of connector is flush; entering edge of connector does not violate component height or lead protrusion requirements; see nonfloating housing.
- Board lock is fully inserted/snapped through the board.
- Any tilt or misalignment, provided:
  - Minimum lead protrusion is met.
  - Maximum height requirements are not exceeded.
  - Mates correctly.

**Figure 7-45 610D Fig 7-043**

**Figure 7-46 610D Fig 7-044**

**Defect - Class 1, 2, 3**
- Will not mate when used in application due to angle or misalignment.
- Component violates height requirements.
- Board lock is not fully inserted/snapped into board.
- Lead protrusion does not meet acceptance requirements.

**Figure 7-47 610D Fig 7-045**

**Note:** Connectors need to meet form, fit and function requirements. A trial mating of connector to connector or to assembly may be required to assure the connectors meet form, fit and function requirement for final acceptance.

</tbody>
</table>

7.1.9 Component Mounting - High Power

Acceptable - Class 1, 2, 3

• Hardware in proper sequence.
• Leads on components attached by fastening devices are not clinched (not shown).
• Insulating washer provides electrical isolation when required.
• Thermal compound, if used, does not interfere with formation of required solder connections.

Note: Where a thermal conductor is specified, it is placed between mating surfaces of the power device and the heat sink. Thermal conductors may consist of a thermally conductive washer or of an insulating washer with a thermally conductive compound.

Acceptable - Class 1, 2, 3

• Improper hardware sequence.
• Sharp edge of washer is against insulator.
• Hardware is not secure.
• Thermal compound, if used, does not permit formation of required solder connections.

Figure 7-53 new

Figure 7-54 610D Fig 7-046

Figure 7-56 610D Fig 7-048

Figure 7-57 610D Fig 7-049

1. Sharp edge of washer against insulator
2. Terminal lug
3. Metal heat sink
7.1.10 Component Mounting – Conductive Cases

Where a potential for shorting (violation of minimum electrical clearance) exists between conductive component bodies, at least 1 of the bodies shall be protected by an insulator.

7.2 Heatsinks

7.2.1 Heatsinks – Insulators and Thermal Compounds

7.2.2 Heatsink – Contact

7.2.2.3 Component Securing

7.2.2.3.1 Component Securing - Mounting Clips

Target - Class 1, 2, 3

- Uninsulated metallic component insulated from underlying circuitry with insulating material.
- Uninsulated metallic clips and holding devices used to secure components insulated from underlying circuitry with insulating material.
- Spacing between land and uninsulated component body exceeds minimum electrical clearance.

Acceptable - Class 1, 2, 3

- The clip makes contact to both sides of the component (A).
- The component is mounted with the center of gravity within the confines of the clip (B, C).
- The end of the component is flush with or extends beyond the end of the clip (C).

Defect - Class 1, 2, 3

- Spacing between land and uninsulated component body is less than minimum electrical clearance (Figure 7-60).
- Uninsulated metallic clip or holding device is not insulated from underlying circuitry.
- Clip does not restrain component (Figure 7-61, A).
- Component center or center of gravity not within the confines of the clip (Figure 7-61, B, C).

7.2.2.2.2 Component Securing - Adhesive Bonding -Non-Elevated Components

The criteria below shall be used when staking is required and criteria are not provided on the drawing. These criteria do not apply to SMT components (see 8.1).

Visual inspection of staking may be performed without magnification. Magnification from 1.75X to 4X may be used for referee purposes.
Refer to adhesive manufacturer’s guidelines for curing requirements.

### 7.2.2.1 Component Securing - Adhesive Bonding - Non-Elevated Components

<table>
<thead>
<tr>
<th>Acceptable - Class 1, 2, 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>• On an unsleeved horizontally mounted component the staking material adheres to component for at least 50% of its length (L), and 25% of its diameter (D), on 1 side. The build up of staking material does not exceed 50% of the component diameter. Adhesion to the mounting surface is evident. The staking material is approximately centered on the body.</td>
</tr>
</tbody>
</table>

| • On an unsleeved vertically mounted component there are a minimum of two beads of staking material for at least 25% of its length (L), and 25% of its circumference. Adhesion to the mounting surface is evident. |

| • Sleeved axial leaded components (except glass bodied components) have staking material in contact with both end faces of the component for 25% to 50% of the component diameter (height). |

| • Glass bodied components are sleeved, when required, prior to staking material attachment. |

| • Adhesives, e.g., staking, bonding, do not contact an unsleeved area of a sleeved glass body component. |

| • Sleeved glass bodied components have staking material applied to both sides of the component from 50% to 100% of the component length for a minimum of 25% of component height. |

| • On multiple vertically mounted components the staking material adheres to each component for at least 50% of its length (L), and the adhesion is continuous between components. Adhesion to the mounting surface is evident. The staking material also adheres to each component for a minimum 25% of its circumference. |

| • Adhesive is cured. |

<table>
<thead>
<tr>
<th>Not Established - Class 1</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Process Indicator - Class 2</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Defect – Class 3</th>
</tr>
</thead>
</table>

| • Staking material in excess of 50% diameter of unsleeved horizontally mounted components provided the top of the component is visible for the entire length of the component body. |

| • Sleeved glass bodied components do not have staking material applied to both sides of the component from 50% to 100% of the component length. |
Process Indicator – Class 1
Defect – Class 2, 3
• Sleeved axial leaded components (except glass bodied components) do not have staking material in contact with both end faces of the component or the adhesive is less than 25% or greater than 50% of the component diameter (height).
• The top of the component body is not visible for the entire length because of staking material coverage.
• Sleeved glass bodied components do not have staking material for a minimum of 25% of component height.
• P1D2D3 Sleeved glass bodied components do not have staking material applied to both sides of the component from 50% to 100% of the component length.

Not Established - Class 1
Defect – Class 2, 3
• The top of sleeved glass bodied components is not visible the entire length of the component body.

Defect - Class 1, 2, 3
• On an unsleeved horizontally mounted component the staking material adheres to component less than 50% of its length (L) or less than 25% of its diameter (D), on 1 side.
• On an unsleeved vertically mounted component there are less than two beads of staking material adhering to the component less than 25% of its length (L) or less than 25% of its circumference.
• Staking material in excess of 50% diameter of horizontally mounted components and the top of the component is not visible for the entire length of the component body.
• On multiple vertically mounted components the staking material adheres to each component for less than 50% of its length (L), for less than 25% of its circumference, and the adhesion is not continuous between components.
• Adhesion to the mounting surface is not evident.
• Uninsulated metallic case components bonded over conductive patterns.
• Staking material on areas to be soldered preventing compliance to Tables 7-4, 7-5 or 7-7.
• Rigid adhesives, e.g., staking, bonding, contact an unsleeved area of a sleeved glass body component, Figure 7-65.
• Staking material is not cured.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

### Component Securing - Adhesive Bonding - Elevated Components

This applies in particular to encapsulated or potted transformers and/or coils that are not mounted flush to the board.

**Figure 7-66 610D Fig 7-066**

- **Acceptable - Class 1, 2, 3**
  - Bonding requirements should be specified in engineering documents, but as a minimum, components weighing 7g or more per lead are bonded to mounting surface in at least 4 places evenly spaced around component when no mechanical support is used (A).
  - At least 20% of the total periphery of the component is bonded (B).
  - Bonding material firmly adheres to both the bottom and sides of the component and to the printed wiring board (C).
  - Adhesive material does not interfere with formation of required solder connection.

- **Defect - Class 1, 2, 3**
  - Bonding requirements are less than specified.
  - Components weighing 7g or more per lead have less than 4 bonding spots (A).
  - Any bonding spots failing to wet and show evidence of adhesion to both the bottom and side of the component and the mounting surface (B).
  - Less than 20% of the total periphery of the component is bonded (C).
  - The bonding material forms too thin a column to provide good support (D).
  - Adhesive material interferes with formation of required solder connection.

**Figure 7-67 610D Fig 7-067**

### Component Securing - Wire Hold Down

**Figure 7-68 610D Fig 7-068**

- **Acceptable - Class 1, 2, 3**
  - Component is held firmly against the mounting surface.
  - There is no damage to the component body or insulation from the securing wire.
  - Metal wire does not violate minimum electrical clearance.

</tr>
</tbody>
</table>

Acceptable - Class 1

Process Indicator - Class 2, 3

- The component or weld bead clearance (C) is greater than the maximum given in Table 7-2.
- The component or weld bead clearance (C) is less than the minimum given in Table 7-2.

Defect - Class 1, 2, 3

- Components violate minimum electrical clearance.
- Component height does not meet form, fit or function.
- Component height (H) exceeds user-determined dimension.

7.3.32.5.3 Supported Holes – Wire/Lead Protrusion

Lead protrusion (Table 7-3) should not allow a possibility of violating minimum electrical spacing, damage to soldered connections due to lead deflection, or penetration of static protective packaging during subsequent handling.

**Note:** High frequency applications may require more precise control of lead extensions to prevent violation of functional design considerations.

<table>
<thead>
<tr>
<th>Table 7-3 Protrusion of Wires/Leads in Supported Holes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Class</td>
</tr>
<tr>
<td>-------</td>
</tr>
<tr>
<td>Class 1</td>
</tr>
<tr>
<td>Class 2</td>
</tr>
<tr>
<td>Class 3</td>
</tr>
</tbody>
</table>

**Note 1:** For boards greater than 2.3 mm [0.0906 in] thick, components having pre-established lead lengths, e.g., DIPs, sockets, connectors, as a minimum components or lead shoulders need to be flush to the board surface, but lead end may not be visible in the subsequent solder connection, see 1.4.1.5. **For components having manufacturer’s pre-established lead lengths that are less than board thickness, and the components or lead shoulders are flush to the board surface, the lead end is not required to be visible in the subsequent solder connection, see 1.4.1.5.**

**Note 2:** Connector leads, relay leads, tempered leads and leads greater than 1.3 mm (.050) diameter are exempt from the maximum length requirement provided that they do not violate minimum electrical spacing.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

**Acceptable – Class 1, 2, 3**
- The leads protrude beyond the land within the specified minimum and maximum (L) of Table 7-3, provided there is no danger of violating minimum electrical clearance.
- The leads meet the design length (L) requirements when specified.

**Defect - Class 1, 2, 3**
- Lead protrusion does not meet the requirements of Table 7-3.
- Lead protrusion violates minimum electrical clearance.
- Lead protrusion exceeds maximum design height requirements.

#### 7.3.4.2.5.4 Supported Holes – Wire/Lead Clinches

Component leads in through-hole connections may be terminated using a straight through, partially clinched or clinched configuration. The clinch should be sufficient to provide mechanical restraint during the soldering process. The orientation of the clinch relative to any conductor is optional. DIP leads should have at least two diagonally opposing leads partially bent outward, be bent outward from the longitudinal axis of the body. Tempered leads and leads greater than 1.3 mm (.050 inch) should not be bent nor formed for mounting purposes. Tempered leads shall not be terminated with a full clinched configuration.

**As a minimum, the lead is discernible in the completed solder connection.** The lead meets the protrusion requirements of Table 7-3 when measured vertically from the land surface and does not violate minimum electrical clearance requirements. Other requirements may be specified on relevant specifications or drawings. Partially clinched leads for part retention are considered as unclenched leads and need to meet protrusion requirements.

**Target - Class 1, 2, 3**
- Lead end is parallel to the board and direction of the clinch is along the connecting conductor.

**Acceptable - Class 1, 2, 3**
- The clinched lead does not violate the minimum electrical clearance (C) between noncommon conductors.
- The protrusion (L) beyond the land is not greater than the similar length allowed for straight-through leads. See Figure 7-79 and Table 7-3.

**Defect - Class 1, 2, 3**
- The lead is clinched toward an electrically noncommon conductor and violates minimum electrical clearance (C).
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

### 7.3.5.5 Supported Holes – Solder

Criteria for soldered supported holes are provided in 7.3.5.1 through 7.3.5.12. These criteria are applicable regardless of the soldering process, e.g., hand soldering, wave soldering, intrusive soldering, etc.

**Figure 7-82 610d Fig 7-102**

**Target - Class 1, 2, 3**
- No void areas or surface imperfections.
- Lead and land are well wetted.
- Lead is discernible.
- 100% solder fillet around lead.
- Solder covers lead and feathers out to a thin edge on land/conductor.
- No evidence of fillet lifting, see 5.2.11.

**Figure 7-83 610d Fig 7-103**

**Acceptable - Class 1, 2, 3**
- Lead is discernible in the solder.

**Figure 7-84 610d Fig 7-104**

**Process Indicator - Class 2, 3**
- Fillet convex, and as an exception to Table 7-4, lead not discernible due to excess solder, providing visual evidence of the lead in the hole can be determined on the primary side.
- Fillet is lifted from land on primary side but there is no land damage (not shown) (see 10.3.2).

**Figure 7-85 610d Fig 7-105**

**Acceptable - Class 1**

**Figure 7-86 610d Fig 7-106**

**Defect - Class 1, 2, 3**
- Lead not discernible due to bent lead.
- Solder not wetted to lead or land.
- Solder coverage does not comply with Tables 7-4 or 7-5.
Table 7-4 Plated-Through Holes with Component Leads - Minimum Acceptable Solder Conditions

<table>
<thead>
<tr>
<th>Criteria</th>
<th>Class 1</th>
<th>Class 2</th>
<th>Class 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>A. Vertical fill of solder(^n) (see 7.3.5.1)</td>
<td>Not Specified</td>
<td>75%</td>
<td>75%</td>
</tr>
<tr>
<td>B. Circumferential wetting of lead and barrel on solder destination side</td>
<td>Not Specified</td>
<td>180°</td>
<td>270°</td>
</tr>
<tr>
<td>C. Percentage of original land area covered with wetted solder on solder destination side</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>D. Circumferential wetting of lead and barrel on solder source side</td>
<td>270°</td>
<td>270°</td>
<td>330°</td>
</tr>
<tr>
<td>E. Percentage of land area covered with wetted solder on secondary side</td>
<td>75%</td>
<td>75%</td>
<td>75%</td>
</tr>
</tbody>
</table>

Note 1. Wetted solder refers to solder applied by the solder process. *For intrusive soldering there may not be an external fillet between the lead and the land.*

Note 2. The 25% unfilled height includes both source and destination side depressions.

Note 3. Class 2 may have less than 75\% vertical hole fill as noted in 7.3.5.1.

Table 7-5 Plated Through Holes with Component Leads – Intrusive Soldering Process – Minimum Acceptable Solder Conditions <combined with table above>

Defect - Class 1, 2, 3
- Solder connections are not in compliance with Table 7-4.

7.3.5.1 Supported Holes – Solder - Vertical fill (A)

- **Target - Class 1, 2, 3**
  - There is 100\% fill.

- **Acceptable - Class 1, 2, 3**
  - Minimum 75\% fill. A maximum of 25\% total depression, including both secondary and primary sides is permitted.

- **Defect - Class 2, 3**
  - Vertical fill of hole is less than 75\%.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

**Figure 7-91 610d Fig 7-111**

- **Not Specified - Class 1**
- **Acceptable - Class 2**
- **Defect - Class 3**
  - As an exception to the fill requirements of Tables 7-4, 7-5, or 7-6, the minimum permissible vertical fill of a PTH is 50% or 1.19mm (0.047 inch), whichever is less. A 50% vertical fill of a PTH is permitted for Class 2 products provided the following conditions are met:
    - The PTH is connected to thermal or conductor plane layers that act as thermal heat sinks.
    - The component lead is discernible in the Side B solder connection of Figure 7-91.
    - The solder fillet on Side B of Figure 7-91 has wetted 360° of the PTH barrel wall and 360° of the lead.
    - Surrounding PTHs meet requirements of Table 7-4.

**Note:** Less than 100% solder fill may not be acceptable in some applications, e.g., thermal shock, electrical performance. The user is responsible for identifying these situations to the manufacturer.

<table>
<thead>
<tr>
<th><strong>7.3.5.2.5.5.5.2 Supported Holes – Solder – Primary Side - Lead to Barrel (B)</strong></th>
</tr>
</thead>
</table>

**Figure 7-92 610d Fig 7-112**

- **Target – Class 1, 2, 3**
  - 360° wetting present on lead and barrel.

**Figure 7-93 610d Fig 7-113**

- **Not Specified - Class 1**
- **Acceptable - Class 2**
  - Minimum 180° wetting present on lead and barrel, Figure 7-93.
- **Acceptable - Class 3**
  - Minimum 270° wetting present on lead and barrel, Figure 7-94.

**Figure 7-95 610d Fig 7-115**

- **Defect - Class 2**
  - Less than 180° wetting on lead or barrel.

**Figure 7-96 new**

- **Defect - Class 3**
  - Less than 270° wetting on lead or barrel.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

### 7.3.5.3 Supported Holes – Solder - Primary Side - Land Area Coverage (C)

**Figure 7-97 610d Fig 7-117**

Acceptable - Class 1, 2, 3
- The land area does not need to be wetted with solder on the primary side.

### 7.3.5.4 Supported Holes – Solder - Secondary Side - Lead to Barrel (D)

**Figure 7-98 610d Fig 7-118**

Acceptable - Class 1, 2
- Minimum 270° fillet and wetting (lead, barrel and termination area).

Acceptable - Class 3
- Minimum 330° fillet and wetting (lead, barrel and termination area). (Not Shown.)

**Figure 7-99 610d Fig 7-119**

Defect – Class 1, 2, 3
- Does not meet requirements of Tables 7-4.

### 7.3.5.5 Supported Holes – Solder - Secondary Side - Land Area Coverage (E)

**Figure 7-100 610d Fig 7-120**

Target – Class 1, 2, 3
- Land area completely covered on the secondary side.

**Figure 7-101 610d Fig 7-121**

Acceptable - Class 1, 2, 3
- Minimum 75% of land area covered with wetted solder on the secondary side.

**Figure 7-102 610d Fig 7-122**

Defect – Class 1, 2, 3
- Does not meet requirements of Tables 7-4 or 7-5.
Supported Holes – Solder Conditions - Solder in Lead Bend

- **Acceptable - Class 1, 2, 3**
  - Solder in lead bend area does not contact the component body.

- **There is no defect provided all other mounting and fillet criteria are acceptable; also see 7.3.5.7.**

Supported Holes – Solder Conditions – Touching Through-Hole Component Body

- **Acceptable – Class 1, 2, 3**
  - Solder does not touch the component body or end seal.

- **Defect - Class 1, 2, 3**
  - Solder in bend area comes in contact with the component body or end seal. Exception see 7.3.5.8.

Supported Holes – Solder Conditions - Meniscus in Solder

- **Target - Class 1, 2, 3**
  - There is 1.2mm (0.048 in) separation between the coating meniscus and the solder fillet.

- **Acceptable Class 1**
  - Components with a coating meniscus can be mounted with the meniscus into the solder provided:
    - 360° wetting on the secondary side.
    - Lead coating meniscus is not discernible within the connection on the secondary side.

- **Acceptable Class 2, 3**
  - Coating meniscus is not in the plated through hole and there is discernible clearance between the meniscus and the solder fillet.

- **Process Indicator - Class 2**
  - Coating meniscus is in the plated through hole but solder joint meets the requirements of Table 7-4.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

**Defect - Class 3**
- Does not meet requirements of Tables 7-6 or 7-7.
- Coating meniscus is in the plated through hole.
- Coating meniscus is embedded in the solder connection.

**Defect - Class 1, 2, 3**
- Does not exhibit good wetting on secondary side.
- Does not meet requirements of Table 7-4 or 7-5.

**Note:** When required for certain applications, meniscus on the components are to be controlled to ensure that, with components fully seated, the meniscus on the leads does not enter the plated-through holes of the assembly. (Example: high frequency applications, very thin PCBs.)

---

### 7.3.5.9 Lead Cutting after Soldering

The following criteria apply to printed board assemblies where the connections have been trimmed after soldering. Leads or the component or solder connection due to physical shock. When for Classes 2 and 3, when lead cutting is performed, visually inspected at 10X to ensure that the original solder connection has not been damaged, i.e., fractured or deformed. As an alternative to visual inspection, the solder connections may be reflowed. If the solder connection is reflowed this is considered part of the soldering process and is not to be considered rework. This requirement is not intended to apply to components which are designed such that a portion of the lead is intended to be removed after soldering, i.e., break away tie bars.

**Acceptable - Class 1, 2, 3**
- No fractures between lead and solder.
- Lead protrusion within specification.

**Defect - Class 1, 2, 3**
- Evidence of fracture between lead and solder fillet.

**Defect – Class 3**
- Lead trimming that cuts into the solder fillet and is not reflowed.

---

### 7.3.5.10 Supported Holes – Coated Wire Insulation in Solder

These requirements apply when the solder connection meets the minimum requirements of Tables 7-4. See 6.2.3 for extruded insulation clearance requirements.

This section applies to coatings that may extend into the connection during soldering operations, provided the material is not corrosive.

**Target - Class 1, 2, 3**
- Clearance of 1 wire diameter between solder fillet and insulation.

**Acceptable - Class 1, 2, 3**
- Clearance of 1 wire diameter between solder fillet and insulation.

**Process Indicator – Class 3**
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

- Coating is entering solder connection on primary side and meets minimum requirements of Table 7-4, or 7-5.
- but exhibits all around good wetting on secondary side.
- Coating is not discernible on secondary side.

**Figure 7-115 610d Fig 7-133**

**Defect - Class 1, 2, 3**
- Solder connection exhibits poor wetting and does not meet the minimum requirements of Tables 7-4.
- Coating is discernible on secondary side.

### 7.3.5.11 Supported Holes – Interfacial Connection without Lead - Vias

**Plated-through Supported** holes used for interfacial connection not exposed to solder because of permanent or temporary masks need not be filled with solder. **Plated-through Supported** holes or vias without leads, after exposure to wave, dip or drag soldering equipment are to meet these acceptability requirements.

**Figure 7-116 610d Fig 7-134**

**Target - Class 1, 2, 3**
- Holes are completely filled with solder.
- The tops of lands show good wetting.

**Figure 7-117 610d Fig 7-135**

**Acceptable - Class 1, 2, 3**
- Sides of holes are wetted with solder.

**Figure 7-118 610d Fig 7-136**

**Acceptable - Class 1**
- **Process Indicator - Class 2, 3**
  - Solder has not wetted side of holes.

**Note:** There is no defect condition for this.

**Note:** Solder capped PTHs have the possibility of entrapping contaminants that are difficult to remove if cleaning is required.

### 7.3.5.12 Supported Holes – Board in Board

No board in board criteria have been established for Class 3 assemblies.

From IPC-T-50: “Daughter Board - A printed board that is fastened to a mother board and electrically connected”

When required, attachment will include additional mechanical support aids, e.g., adhesives or hardware, to ensure the connections will not be damaged in the intended service environment.

**Table 7-5 Board in Board - Minimum Acceptable Solder Conditions**

<table>

<th>50%</th>
<th>75%</th>
</tr>
</thead>
<tbody>
<tr>
<td>Percentage of land area on PCA (mother board) covered with wetted solder on primary side (solder destination side)</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Fillet and wetting solder connection width on secondary side (solder source side) of PCA (mother board) to lands on both sides of daughter board.</td>
<td>50%</td>
<td>75%</td>
</tr>
<tr>
<td>Percentage of land area on PCA (mother board) covered with wetted solder on secondary side (solder source side)</td>
<td>75%</td>
<td>75%</td>
</tr>
</tbody>
</table>

**Note 1.** Wetted solder refers to solder applied by the solder process.

**Note 2.** The 25% unfilled height includes both source and destination side depressions.

**Figure 7-119 NEW**

**Acceptable – Class 1, 2**
- Daughter board is mounted perpendicular to PCA.
- Daughter board is flush to PCA.
- Mechanical constraints, if required, are properly attached.
- Vertical fill of solder is 75%.

**Figure 7-120 NEW**

**Acceptable – Class 1**
- Solder is wetted a minimum of 50% width (X) of each of the sides of the daughter board lands (L) to PCA on secondary side (solder source side).

**Figure 7-121 NEW**

**Acceptable – Class 2**
- Solder is wetted a minimum of 75% width (X) of each of the sides of the daughter board land (L) to PCA on primary side (solder destination side).

**Figure 7-122 NEW**

**Defect – Class 1, 2**
- Daughter board angle stresses mounting through-hole tabs.
- Required mechanical constraints not present or not properly attached.
- Vertical fill of solder is less than 75%.
- Solder not wetted to each of the sides of daughter board lands or PCA land.

**Figure 7-123 NEW**

**Figure 7-124 NEW**
Defect – Class 1
• Solder is wetted less than 50% width (X) of both sides of the daughter board land (L) to PCA on secondary side (solder source side).
• Solder is wetted less than 50% width (X) of each of the sides of the daughter board land (L) to PCA on primary side (solder destination side).

Defect – Class 2
• Solder is wetted less than 75% width (X) of each of the sides of the daughter board land (L) to PCA on secondary side (solder source side).
• Solder is wetted less than 75% width (X) of each of the sides of the daughter board land (L) to PCA on primary side (solder destination side).

7.4 Unsupported Holes
Component leads in through-hole connections may be terminated using a straight through, a partially-clinched, or clinched configuration.

7.4.1 Unsupported Holes – Axial Leads - Horizontal

Target - Class 1, 2, 3
• The entire body length of the component is in contact with the board surface.
• Components required to be mounted off the board are at minimum 1.5 mm [0.059 in] from the board surface; e.g., high heat dissipating.
• Components required to be mounted off the board are provided with lead forms at the board surface or other mechanical support to prevent lifting of solder land.

Defect - Class 1, 2, 3
• Components required to be mounted off the board are not provided with lead forms at the board surface or other mechanical support to prevent lifting of solder land.
• Components required to be mounted above the board surface are less than 1.5 mm [0.059 in].
• Component height exceeds user-determined dimension.

Defect – Class 3
• No lead clinch.
7.4.2 Unsupported Holes – Axial Leads - Vertical

Target - Class 1, 2, 3
- Components that are mounted above the board surface in unsupported holes are provided with lead forms or other mechanical support to prevent lifting of solder land.

Defect - Class 1, 2, 3
- Components mounted above the board in unsupported holes are mounted without lead form at the board surface or other mechanical support.

7.4.3 Unsupported Holes –Wire/Lead Protrusion

Lead protrusion (Table 7-2) should not allow a possibility of violating of minimum electrical clearance, damage to soldered connections due to lead deflection, or penetration of static protective packaging during subsequent handling. <moved to Note under Table 7-6>

Note: High frequency applications may require more precise control of lead extensions to prevent violation of functional design considerations.

Target
- The protrusion of leads and wires beyond the conductive surface is (L) or as specified on the specification or drawing.

Acceptable – Class 1, 2, 3
- The leads protrude beyond the land within the specified minimum and maximum (L) of Table 7-6, provided there is no danger of violating minimum electrical clearance.

Defect - Class 1, 2, 3
- Lead protrusion does not meet Table 7-6 requirements.
- Lead protrusion violates minimum electrical clearance.
- Lead protrusion exceeds maximum design height requirements.

Table 7-6 Protrusion of Leads in Unsupported Holes

<table>
<thead>
<tr>
<th>Class</th>
<th>Class 1</th>
<th>Class 2</th>
<th>Class 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>(L) min</td>
<td>End is discernible in solder</td>
<td>Sufficient to clinch</td>
<td></td>
</tr>
<tr>
<td>(L) max</td>
<td>No danger of shorts</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Note 1. Lead protrusion should not exceed 2.5 mm [0.0984 in] if there is a possibility of violation of minimum electrical spacing, damage to soldered connections due to lead deflection or penetration of static protective packaging during subsequent handling or operating environments.
This section applies to terminations with a clinching requirement. Other requirements may be specified on relevant specifications or drawings. Partially clinched leads for part retention are considered as unclinched leads and need to meet protrusion requirements.

Class 3 lead terminations in unsupported holes are clinched a minimum of 45°.

The clinch should be sufficient to provide mechanical restraint during the soldering process. The orientation of the clinch relative to any conductor is optional. DIP leads should have at least two diagonally opposing leads partially bent outward. DIP leads should be bent outward from the longitudinal axis of the body. Tempered leads and leads greater than 1.3 mm (.050 inch) should not be bent nor formed for mounting purposes. Tempered leads are not terminated with a full-clinched configuration.

As a minimum, the lead is discernible in the completed solder connection. The lead meets the requirements of Table 7-6 when measured vertically from the land surface and does not violate minimum electrical clearance requirements.

**Target - Class 1, 2, 3**
- Lead end is parallel to the board and direction of the clinch is along the connecting conductor.

**Acceptable - Class 1, 2, 3**
- The clinched lead does not violate the minimum electrical clearance (C) between noncommon conductors.
- The protrusion (L) beyond the land is not greater than the similar length allowed for straight-through leads.
- The leads protrude beyond the land within the specified minimum and maximum (L) of Table 7-6, provided there is no violation of minimum electrical clearance.

**Acceptable – Class 3**
- Lead in unsupported hole is clinched a minimum of 45°.

**Defect - Class 1, 2, 3**
- The lead is clinched toward an electrically noncommon conductor and violates minimum electrical clearance (C).
- Lead protrusion is insufficient for clinch, if required.

**Defect - Class 3**
- Lead in unsupported hole is not clinched a minimum of 45° (not shown).
7.4.5 Unsupported Holes – Solder

Table 7-7 Unsupported Holes with Component Leads, Minimum Acceptable Conditions

<table>
<thead>
<tr>
<th>Criteria</th>
<th>Class 1</th>
<th>Class 2</th>
<th>Class 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>A. Fillet wetted to and wetting of lead and land</td>
<td>270º</td>
<td>270º</td>
<td>330º Note 2.</td>
</tr>
<tr>
<td>B. Percentage of land area covered with wetted solder</td>
<td>75%</td>
<td>75%</td>
<td>75%</td>
</tr>
</tbody>
</table>

Note 1. A and B are applicable to both sides of double sided boards with functional lands on both sides.
Note 2. For Class 3, lead is wetted in the clinched area.
Note 3. Solder is not required to cap or cover the hole.
Note 4. Double sided boards with functional lands on both sides need to comply to A and B on both sides.
Note 5. Wetted solder refers to solder applied by the solder process.

Target Class 1, 2, 3
- Solder termination, (land and lead), covered with wetted solder and outline of lead discernible in the solder fillet.
- No void areas or surface imperfections.
- Lead and land are well wetted.
- Lead is clinched.
- 100% solder fillet around lead.

Acceptable – Class 1, 2
- Solder coverage meets requirements of Table 7-7.

Acceptable – Class 3
- Lead is wetted in the clinched area.
- Minimum of 330º fillet and wetting.

Acceptable – Class 1, 2, 3
- Minimum 75% of land area covered with wetted solder on the secondary side (not shown).

Defect – Class 1, 2
- Solder connection of straight through termination does not meet minimum of 270º circumferential fillet or wetting.
- Less than 75% land coverage.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

**Defect – Class 3**
- Solder connection does not meet 330° circumferential fillet or wetting.
- Lead not clinched (not shown).
- Lead not wetted in clinched area.
- Less than 75% land coverage.

**Defect - Class 1, 2, 3**
- Lead not discernible due to excess solder.

---

7.4.6 **Unsupported Holes – Lead Cutting after Soldering**

The criteria in 7.3.5.9 are also applicable to solder connections in unsupported holes.

---

7.5**1.2 Jumper Wires**

These criteria do not constitute authority for repair to assemblies without prior customer consent; see 1.1. This section establishes visual acceptability criteria for the installation of discrete wires (jumper wires, haywires, etc.) used to interconnect components where there is no continuous printed circuit.

The requirements relative to wire type, wire routing, staking and soldering requirements are the same for both haywires and jumper wires. For the sake of simplicity only the more common term, jumper wires, is used in this section; however these requirements would apply to both haywires and jumper wires.

Information concerning rework and repair can be found in IPC-7711/7721.

The following items are addressed:
- Wire selection
- Wire routing
- Adhesive staking of wire
- Solder termination

They may be terminated in plated holes, and/or to terminal standoffs, conductor lands, and component leads.

Jumper wires are considered as components and are covered by an engineering instruction document for routing, termination, staking and wire type.

Keep jumper wires as short as practical and unless otherwise documented do not route over or under other replaceable components. Design constraints such as real estate availability and minimum electrical clearance need to be taken into consideration when routing or staking wires. A jumper wire 25 mm [0.984 in] maximum in length whose path does not pass over conductive areas and do not violate the designed spacing requirements may be uninsulated. Insulation, when required on the jumper wires, shall be compatible with conformal coating when conformal coating is required.

**Acceptable – Class 1, 2, 3**
- The insulation is in contact with the solder but does not interfere with formation of an acceptable connection.

**Defect – Class 1, 2, 3**
- Insulation interferes with formation of the solder connection.

---

7.5.14.2.1 **Jumper Wires - Wire Selection**
The following considerations are to be made when selecting wires for jumpers:

1. Wire is insulated if greater than 25 mm [0.984 in] in length or is liable to short between lands or component leads.
2. Silver plated stranded wire should not be used. Under some conditions corrosion of the wire can occur.
3. Select the smallest diameter wire that will carry the required current needs.
4. The insulation of the wire should withstand soldering temperatures, have some resistance to abrasion, and have a dielectric resistance equal to or better than the board insulation material.
5. Recommended wire is solid, insulated, plated copper wire.
6. Chemical solutions, pastes, and creams used to strip solid wires do not cause degradation to the wire.

**7.5.211.2.2 Jumper Wires - Wire Routing**

Unless otherwise specified by high speed/high frequency requirements, route jumper wires the shortest route in straight legs as possible, avoiding test points, to points of termination. Allow enough length for routing, stripping and attachment.

Jumper wire routing on assemblies having the same part number should be the same pattern.

Routing **shall** be documented for each part number and followed without deviation.

*On the primary side,* do not allow jumper wires to pass over or under any component, however, they may pass over parts such as thermal mounting plates, brackets and components that are bonded to the PWB.

*On the primary side,* jumpers may pass over solder lands if sufficient slack is provided so they can be moved away from the solder land for component replacement.

Contact with heat sinks specific to high temperature generating components **shall** be avoided.

*On secondary side,* except for connectors at the edge of the board, do not pass jumpers through component foot prints unless the layout of the assembly prohibits the routing in other areas.

*On the secondary side,* do not pass jumpers over patterns or vias used as a test point.

**Target - Class 1, 2, 3**
- Wire routed shortest route.
- Wire does not pass over or under component.
- Wire does not pass over land patterns or vias used as test points.
- Wire does not cross component footprint or lands.

**Acceptable - Class 1, 2, 3**
- Lands not covered by wire.
- Sufficient slack in wire to allow relocation from unavoidable lands during component replacement or test.

**Acceptable - Class 1**

**Process Indicator - Class 2, 3**
- Insufficient slack in wire to allow relocation from unavoidable lands during component replacement.
- Unavoidable crossing of component footprint or land area.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

Acceptable - Class 1
Defect - Class 2,3

• Wire routed under or over components.
• Routing of wire(s) overhang or wrap over the edge of the board.

Note: Take in consideration the trapping of contaminants when wires are routed under components. When routed over components consider the implications of wires coming in contact with heat sinks or hot components and electrical interference in RF applications.

<table>
<thead>
<tr>
<th>7.5.34.2.3 Jumper Wires - Wire Staking</th>
</tr>
</thead>
</table>

Jumper wires may be staked to the base material (or integral thermal mounting plate or hardware) by adhesive or tape (dots or strips). When adhesive is used, it is to be mixed and cured in accordance with the manufacturer's instructions. All adhesive must be fully cured before acceptance. Consider the end-use product environment as well as subsequent process compatibility when selecting the appropriate staking method.

Spot bond so that the stake fillet is sufficient to secure the wire with no excessive spillover onto adjacent lands or components.

Staking shall not be on a removable or socketed component. Where design constraints are an obstacle, staking is to be discussed with the customer.

Jumper wires shall not be staked to, or allowed to touch, any moving parts. Wires are staked within the radius of each bend for each change of direction.

<table>
<thead>
<tr>

<table>
<thead>
<tr>
<th>7.5.41.2.4 Jumper Wires - Plated-Through Supported Holes</th>
</tr>
</thead>
</table>

Acceptable - Class 1
Defect - Class 2,3

• The wire is loose and can extend above the height of adjacent components when pulled taut.
• Jumper wires are not staked as specified.
• Staking tape/adhesive overhang the board edge(s) or violate edge spacing requirements.

Defect - Class 1,2,3

• Adhesive, when used, is not cured.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

Jumper wires may be attached by any of the following methods. However, the method used for a particular assembly type needs to be defined.

This section is intended to show jumper wire practices that are used in original manufacturing. See IPC-7711/7721 for additional jumper wire information when affecting repairs and modifications.

For jumper wires attached to components other than axial leaded, lap solder the wire to the component lead.

Assure the solder connection length and insulation clearance meet the minimum/maximum acceptability requirements, see 6.2.3.

### 7.5.4.1.11.2.4.1 Jumper Wires - PTH/Via-Supported Hole - Lead in Hole

<table>

<td><strong>Insulation is in the solder connection.</strong></td>
</tr>
<tr>
<td>Wire overhang violates minimum electrical clearance.</td>
</tr>
</tbody>
</table>
For jumper wires attached to components other than axial leaded, lap solder the wire to the component lead.

**Acceptable – Class 1,2,3**

- Wire is lap soldered to a component lead a minimum of 75% of (L) (from edge of land to knee of lead).
- Wire is lap soldered to a PTH/via surface.
- Acceptable solder connection at wire/lead interface.
- Wire discernible in the solder.

**Defect - Class 1,2,3**

- Wire that is lap soldered is less than 75% of (L) (from edge of land to knee of lead). Insulation interferes with formation of the solder connection.
- Wire overhang extends beyond the knee of component lead violates minimum electrical clearance.
- Lead violates minimum electrical clearance.

**Figure 7-162 610D-11-042**
8 Surface Mount Assemblies

This section covers acceptability requirements for the fabrication of surface mount assemblies.

In this Standard, the words “plastic component” are used in the generic sense to differentiate between plastic components and those made of other materials, e.g., ceramic/alumina or metal (normally hermetically sealed).

Some dimensions, e.g. solder thickness, are not inspectable conditions and are identified by notes.

Dimension (G) is the solder fillet from the top of the land to the bottom of the termination. Dimension (G) is the prime parameter in the determination of solder connection reliability for leadless components. A thick (G) is desirable. Additional information related to reliability of surface mount connections is available in IPC-D-279, IPC-SM-785 and IPC-9701.

In addition to the criteria in this section the criteria of Section 5 are applicable.

The following topics are addressed in this section:

8.1 Staking Adhesive
8.1.1 Staking Adhesive – Component Bonding
8.1.2 Staking Adhesive – Mechanical Strength

8.2 SMT Leads
8.2.1 Damage
8.2.2 Flattening

8.3 SMT Connections
8.3.1 Chip Components - Bottom Only Terminations
8.3.1.1 Side Overhang (A)
8.3.1.2 End Overhang (B)
8.3.1.3 End Joint Width (C)
8.3.1.4 Side Joint Length (D)
8.3.1.5 Maximum Fillet Height (E)
8.3.1.6 Minimum Fillet Height (F)
8.3.1.7 Solder Thickness (G)
8.3.1.8 End Overlap (J)

8.3.2 Rectangular or Square End Chip Components - 1, 3 or 5 Side Terminations
8.3.2.1 Side Overhang (A)
8.3.2.2 End Overhang (B)
8.3.2.3 End Joint Width (C)
8.3.2.4 Side Joint Length (D)
8.3.2.5 Maximum Fillet Height (E)
8.3.2.6 Minimum Fillet Height (F)
8.3.2.7 Thickness (G)
8.3.2.8 End Overlap (J)

8.3.2.9 Termination Variations
8.3.2.9.1 Mounting on Side (Billboarding)
8.3.2.9.2 Mounting Upside Down
8.3.2.9.3 Stacking
8.3.2.9.4 Tombstoning

8.3.3 Cylindrical End Cap Termination
8.3.3.1 Side Overhang (A)
8.3.3.2 End Overhang (B)
8.3.3.3 End Joint Width (C)
8.3.3.4 Side Joint Length (D)
8.3.3.5 Maximum Fillet Height (E)
8.3.3.6 Minimum Fillet Height (F)
8.3.3.7 Solder Thickness (G)
8.3.3.8 End Overlap (J)

8.3.4 Castellated Terminations
8.3.4.1 Side Overhang (A)
8.3.4.2 End Overhang (B)
8.3.4.3 Minimum End Joint Width (C)
8.3.4.4 Minimum Side Joint Length (D)
8.3.4.5 Maximum Fillet Height (E)
8.3.4.6 Minimum Fillet Height (F)
8.3.4.7 Solder Thickness (G)

8.3.5 Flat Gull Wing Leads
8.3.5.1 Side Overhang (A)
8.3.5.2 Toe Overhang (B)
8.3.5.3 Minimum End Joint Width (C)
8.3.5.4 Minimum Side Joint Length (D)
8.3.5.5 Maximum Fillet Height (E)
8.3.5.6 Minimum Fillet Height (F)
8.3.5.7 Solder Thickness (G)
8.3.5.8 Coplanarity

8.3.6 Round or Flattened (Coined) Gull Wing Leads
8.3.6.1 Side Overhang (A)
8.3.6.2 Toe Overhang (B)
8.3.6.3 Minimum End Joint Width (C)
8.3.6.4 Minimum Side Joint Length (D)
8.3.6.5 Maximum Heel Fillet Height (E)
8.3.6.6 Minimum Heel Fillet Height (F)
8.3.6.7 Solder Thickness (G)
8.3.6.8 Minimum Side Joint Height (Q)
8.3.6.9 Coplanarity

8.3.7 J Leads
8.3.7.1 Side Overhang (A)
8.3.7.2 J-Leads, Toe Overhang (B)
8.3.7.3 End Joint Width (C)
8.3.7.4 Side Joint Length (D)
8.3.7.5 Maximum Fillet Height (E)
8.3.7.6 Minimum Heel Fillet Height (F)
8.3.7.7 Solder Thickness (G)
8.3.7.8 Coplanarity
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

8.3.8 Butt/I Connections
- 8.3.8.1 Maximum Side Overhang (A)
- 8.3.8.2 Maximum Toe Overhang (B)
- 8.3.8.3 Minimum End Joint Width (C)
- 8.3.8.4 Minimum Side Joint Length (D)
- 8.3.8.5 Maximum Fillet Height (E)
- 8.3.8.6 Minimum Fillet Height (F)
- 8.3.8.7 Solder Thickness (G)

8.3.9 Flat Lug Leads

8.3.10 Tall Profile Components Having Bottom Only Terminations

8.3.11 Inward Formed L-shaped Ribbon Leads

8.3.12 Surface Mount Area Array
- 8.3.12.1 Alignment
- 8.3.12.2 Solder Ball Spacing
- 8.3.12.3 Solder Connections
- 8.3.12.4 Voids
- 8.3.12.5 Underfill/Staking
- 8.3.12.6 Package on Package

8.3.13 Bottom Termination Components (BTC)

8.3.14 Components with Bottom Thermal Plane Terminations

8.3.15 Flatten Post Connections
- 8.3.15.1 Maximum Termination Overhang – Square Solder Land
- 8.3.15.2 Maximum Termination Overhang – Round Solder Land
- 8.3.15.3 Maximum Fillet Height

8.4 Specialized SMT Terminations

8.5 Surface Mount Connectors

8.6 Jumper Wires
- 8.6.1 Jumper Wires – SMT
- 8.6.1.1 Chip and Cylindrical End Cap Components
- 8.6.1.2 Gull Wing
- 8.6.1.3 J Lead
- 8.6.1.4 Castellations
- 8.6.1.5 Land

8.1 Staking Adhesive

8.1.1 Staking Adhesive – Component Bonding

**Target - Class 1, 2, 3**
- No adhesive present on solderable surfaces of the termination area.
- Adhesive is centered between the lands.

**Acceptable – Class 1**
**Process Indicator – Class 2**
- Adhesive material extending from under the component is visible in the termination area, but end joint width meets minimum requirements.

**Defect - Class 3**
- Adhesive materials extending from under the component are visible in the termination area.

Figure 8-1 610D-08-001

Figure 8-2 610D-08-002

Figure 8-3 610D-08-003

Figure 8-4 610D-08-004
8.1.2 Staking Adhesive – Mechanical Strength

**Target – Class 1, 2, 3**
- On SMT components the adhesive is:
- 50% of the component height.
- Equal to or greater than 25% of the circumference.

Note: The circumference bonding may have 1 or more adhesive points.

**Acceptable – Class 1, 2, 3**
- On SMT components the adhesive is 25% to 50% of the component height.
- Adhesion to the mounting surface is evident.
- Staking is completely cured and homogenous.
- Staking is free of voids or bubbles that expose component conductors or bridge noncommon conductors.
- Staking does not prevent stress relief.

**Acceptable – Class 1**
**Process Indicator - Class 2, 3**
- Adhesive on lands or conductive patterns does not interfere with the formation of solder connection.

**Not Established – Class 1**
**Acceptable - Class 2, 3**
- Rectangular components are staked at each corner of the component for a minimum 25% to maximum 100% of the height of the component body. (Slight flow under the component body is acceptable provided it does not damage the components or assembly in its intended service environment.)
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

**Defect – Class 1, 2 & 3**
- On SMT components the adhesive is less than:
  - 25% of the component height.
  - 25% of the circumference.
- There are less than two beads of staking material on an unsleeved vertically mounted component.
- Adhesion to the PCB & component surface is not evident.
- Required marking is covered.
- The adhesive interferes with the formation of required solder connections.
- Staking is not completely cured and homogenous.
- Staking voids or bubbles expose component conductors or bridge noncommon conductors.
- Staking prevents stress relief.

**Defect - Class 2, 3**
- Rectangular components are not staked at each corner of the component for a minimum 25% to maximum 100% of the height of the component body.
- Flow of staking material under the component body will damage the components or assembly in its intended service environment.

---

**8.2 SMT Leads**

**8.2.1 SMT Leads - Damage**

These criteria are applicable whether leads are formed manually or by machine or die.

**Acceptable - Class 1, 2, 3**
- No nicks or deformation exceeding 10% of the diameter, width or thickness of the lead. See 5.2.1 for exposed basis metal criteria.

**Defect - Class 1, 2, 3**
- Lead is damaged or deformed more than 10% of the diameter, width or thickness of the lead.
- Lead is deformed from repeated or careless bending.
- Heavy indentations such as serrated pliers mark.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

### 8.2.2 SMT Leads - Flattening

Components with axial leads of round cross-section may be flattened (coined) for positive seating in surface mounting. Intentionally flattened areas of leads are excluded from the 10% deformation requirement of 8.2.

**Acceptable - Class 1, 2**

**Defect - Class 3**

- Flattened thickness is less than 40% of the original diameter.

### 8.2.3 SMT Connections

SMT connections must meet the criteria are provided in 8.3.1 through 8.3.15, as appropriate.

### 8.3.18.2.4 Chip Components - Bottom Only Terminations

Discrete chip components, leadless chip carriers, and other devices that have metal terminations on the bottom side only shall meet the dimensional and solder fillet requirements listed below for each product classification. The widths of the component and land are (W) and (P), respectively, and the termination overhang describes the condition where the smaller extends beyond the larger termination (i.e., W or P). The length of the component termination is (R) and the length of the land is (S).

**Note 1.** Does not violate minimum electrical clearance.

**Note 2.** Unspecified parameter or variable in size, determined by design.

**Note 3.** Wetting is evident.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

### 8.3.1.1 Chip Components - Bottom Only Terminations, Side Overhang (A)

**Figure 8-11 610D-08-005**

**Target - Class 1, 2, 3**
- No side overhang.

**Acceptable - Class 1, 2**
- Side overhang (A) is less than or equal to 50% width of component termination area (W) or 50% width of land (P), whichever is less.

**Acceptable - Class 3**
- Side overhang (A) is less than or equal to 25% width of component termination area (W) or 25% width of land (P), whichever is less.

**Defect - Class 1, 2**
- Side overhang (A) is greater than 50% component termination width (W) or 50% land width (P), whichever is less.

**Defect - Class 3**
- Side overhang (A) is greater than 25% component termination width (W) or 25% land width (P), whichever is less.

### 8.3.1.2 Chip Components - Bottom Only Terminations, End Overhang (B)

**Figure 610e-8-12 new**

**Defect - Class 1, 2, 3**
- End overhang (B) in Y axis is not permitted.

### 8.3.1.3 Chip Components - Bottom Only Terminations, End Joint Width (C)

**Figure 8-13 610D-08-007**

**Target - Class 1, 2, 3**
- End joint width (C) is equal to the width of the component termination (W) or width of land (P), whichever is less.

**Acceptable - Class 1, 2**
- Minimum end joint width (C) is 50% width of component termination (W) or 50% width of land (P), whichever is less.

**Acceptable - Class 3**
- Minimum end joint width (C) is 75% width of component termination (W) or 75% width of land (P), whichever is less.

**Defect - Class 1, 2**
- End joint width (C) is less than 50% width of component termination (W) or less than 50% width of land (P), whichever is less.
Defect - Class 3
• End joint width (C) is less than 75% width of component termination (W) or less than 75% width of land (P), whichever is less.

### 8.3.1.4 Chip Components - Bottom Only Terminations, Side Joint Length (D)

**Figure 8-14 610D-08-008 CHANGE “L” TO “R”**

<table>
<thead>
<tr>
<th>Target - Class 1, 2, 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Side joint length (D) equals component termination length (L-R).</td>
</tr>
</tbody>
</table>

**Acceptable - Class 1, 2, 3**
• Any side joint length (D) is acceptable if all other solder requirements are met.

### 8.3.1.5 Chip Components - Bottom Only Terminations, Maximum Fillet Height (E)

Maximum fillet height (E) requirements are not specified for Class 1, 2, 3. However, wetting is evident.

**Defect – Class 1, 2, 3**
• No wetting evident.

### 8.3.1.6 Chip Components - Bottom Only Terminations, Minimum Fillet Height (F)

Minimum fillet height (F) requirements are not specified for Class 1, 2, 3. However, a wetted fillet is evident.

**Figure 8-15 610D-08-009**

**Defect – Class 1, 2, 3**
• No wetting evident.

### 8.3.1.7 Chip Components - Bottom Only Terminations, Solder Thickness (G)

**Figure 8-16 610D-08-010**

**Acceptable - Class 1, 2, 3**
• Wetting is evident.

**Defect – Class 1, 2, 3**
• No wetting evident.
### 8.3.1.8.2.1.8 Chip Components - Bottom Only Terminations, End Overlap (J)

<table>
<thead>
<tr>
<th>Figure 8-17 new</th>
</tr>
</thead>
</table>

**Acceptable – Class 1, 2, 3**
- Evidence of overlap contact (J) between the component termination and the land is required.

**Acceptable - Class 1**
- Wetted fillet is evident.

**Acceptable - Class 2**
- End overlap (J) between the component termination and the land is minimum 50% the length of component termination (R).

**Acceptable - Class 3**
- End overlap (J) between the component termination and the land is minimum of 75% the length of component termination (R).

**Defect - Class 1, 2, 3**
- Insufficient end overlap.
- Component termination area and land do not overlap.

**Defect - Class 2**
- End overlap (J) is less than 50% of the length of component termination (R).

**Defect - Class 3**
- End overlap (J) is less than 75% of the length of component termination (R).
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

### 8.3.2.2 Rectangular or Square End Chip Components - 1, 3 or 5 Side Terminations

These criteria apply to component types such as chip resistor, chip capacitor, network passive parts (R-NET, etc. that have this style of termination) and cylindrical components with square ends, MELF.

Solder connections to components having terminations of a square or rectangular configuration shall meet the dimensional and solder fillet requirements listed below for each product classification. For 1 sided termination, the solderable side is the vertical end face of the component.

#### Table 8-2 Dimensional Criteria - Chip Components - Rectangular or Square End Components - 1, 3 or 5 Side Terminations

#### Side Mounting/Boarding, Notes 7, 8

- **Note 1**: Does not violate minimum electrical clearance.
- **Note 2**: Unspecified dimension, or variable in size as determined by design.
- **Note 3**: Wetting is evident.
- **Note 4**: The maximum fillet may overhang the land and/or extend onto the top of the end cap metallization; however, the solder does not extend further onto the top of the component body.
- **Note 5**: (C) is measured from the narrowest side of the solder fillet.

#### Terminations

- **Note 6**: Designs with open, unfilled via in pad land may preclude meeting these criteria. Solder acceptance criteria should be defined between the user and the manufacturer.
- **Note 7**: These criteria are for chip components that may flip (rotate) onto the narrow edge during assembly.
- **Note 8**: These criteria may not be acceptable for certain high frequency or high vibration applications.
8.3.2.1 Rectangular or Square End Chip Components – 1, 3 or 5 side Terminations, Side Overhang (A)

- **Figure 8-18 610D-08-011** Target - Class 1, 2, 3
  - No side overhang.

- **Figure 8-19 610D-08-012** Acceptable - Class 1, 2
  - Side overhang (A) is less than or equal to 50% width of component termination area (W) or 50% width of land (P), whichever is less.
  
  Acceptable - Class 3
  - Side overhang (A) is less than or equal to 25% width of component termination area (W) or 25% width of land (P), whichever is less.

- **Figure 8-20 610D-08-013** Defect - Class 1, 2
  - Side overhang (A) is greater than 50% component termination width (W) or 50% land width (P), whichever is less.

- **Figure 8-21 610D-08-014** Defect - Class 3
  - Side overhang (A) is greater than 25% component termination width (W) or 25% land width (P), whichever is less.

- **Figure 8-22 610D-08-015**

8.3.2.2 Rectangular or Square End Chip Components - 1, 3 or 5 Side Terminations, End Overhang (B)

- **Figure 8-23 610D-08-016** Target - Class 1, 2, 3
  - No end overhang.

- **Figure 8-24 610D-08-017** Defect - Class 1, 2, 3
  - Termination overhangs land.

8.3.2.3 Rectangular or Square End Chip Components - 1, 3 or 5 Side Terminations, End Joint Width (C)

- **Figure 8-25 610D-08-018** Target - Class 1, 2, 3
  - End joint width is equal to component termination width or width of land, whichever is less.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

**Rectangular or Square End Chip Components - 1, 3 or 5 Side Terminations, Side Joint Length (D)**

**Figure 8-26 610D-08-019**

Acceptable - Class 1, 2
- End joint width (C) is minimum 50% of component termination width (W) or 50% land width (P), whichever is less.

**Figure 8-27 New**

Acceptable - Class 3
- End joint width (C) is minimum 75% of component termination (W) or 75% land width (P), whichever is less.

**Figure 8-28 610D-08-020**

**Figure 8-29 610D-08-021**

Defect - Class 1, 2, 3
- Less than minimum acceptable end joint width.

**Rectangular or Square End Chip Components - 1, 3 or 5 Side Terminations, Maximum Fillet Height (E)**

**Figure 8-30 610D-08-022**

Target - Class 1, 2, 3
- Side joint length equals length of component termination.

Acceptable - Class 1, 2, 3
- Side joint length is not required. However, a wetted fillet is evident.

Defect – Class 1, 2, 3
- No wetted fillet.

**Figure 8-31 610D-08-023**

**Figure 8-32 610D-08-024**

Target - Class 1, 2, 3
- Maximum fillet height is the solder thickness plus component termination height.

Acceptable - Class 1, 2, 3
- Maximum fillet height (E) may overhang the land and/or extend onto the top of the end cap metallization, but not extend further onto the top of component body.

Defect - Class 1, 2, 3
- Solder fillet extends onto the top of the component body.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

### 8.3.2.6 Rectangular or Square End Chip Components - 1, 3 or 5 Side Terminations, Minimum Fillet Height (F)

**Acceptable - Class 1, 2**
- Wetting is evident on the vertical surface(s) of the component termination.

**Acceptable - Class 3**
- Minimum fillet height (F) is solder thickness (G) plus 25% termination height (H), or 0.5 mm [0.02 in], whichever is less.

**Defect – Class 1, 2**
- No fillet height evident on face of component.

**Defect - Class 3**
- Minimum fillet height (F) is less than solder thickness (G) plus 25% (H), or solder thickness (G) plus 0.5 mm [0.02 in], whichever is less.

### 8.3.2.7 Rectangular or Square End Chip Components - 1, 3 or 5 Side Terminations, Thickness (G)

**Acceptable - Class 1, 2, 3**
- Wetted fillet evident.

**Defect – Class 1, 2, 3**
- Insufficient solder.
- A wetted fillet is not evident.
8.3.2.8 Rectangular or Square End Chip Components - 1, 3 or 5 Sided Terminations, End Overlap (J)

Acceptable - Class 1, 2, 3
- Evidence of overlap contact (J) between the component termination and the land is required.

Acceptable - Class 1
- Wetted fillet is evident.

Acceptable - Class 2
- End overlap (J) between the component termination and the land is minimum 50% the length of component termination (R).

Acceptable - Class 3
- End overlap (J) between the component termination and the land is minimum of 75% the length of component termination (R).

Defect - Class 1, 2, 3
- Insufficient end overlap: Component termination area and land do not overlap.

Defect - Class 2
- End overlap (J) is less than 50% of the length of component termination (R).

Defect - Class 3
- End overlap (J) is less than 75% of the length of component termination (R).

8.3.2.9 Chip Components - Rectangular or Square End Chip Components - 1, 3 or 5 Sided Terminations, Termination Variations

This section provides criteria for chip components that may flip (rotate) onto the narrow edge during assembly.

These criteria may not be acceptable for certain high frequency or high vibration applications.

Acceptable - Class 1, 2, 3
- Width (W) to height (H) ratio does not exceed two to one (2:1) ratio; see Figure 8-42.
- Complete wetting to land and end cap metallization.
- Overlap contact between 100% of the component termination (metallization) and the land.
- Component has three or more termination faces (metallization).
- There is evidence of wetting on the three vertical faces of the termination area.

Figure 8-39 610D-08-030

Figure 8-40 610D-08-031

Figure 8-41 610D-08-032

Figure 8-42 610D-08-033

Figure 8-43 610D-08-034
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

### Acceptable - Class 1, 2
- Component size may be larger than 1206.

#### Figure 8-44 610D-08-035
**Defect - Class 1, 2, 3**
- Width to height ratio exceeds two to one (2:1) ratio.
- Incomplete wetting of at least three component termination faces to the land.
- Less than 100% overlap of the component termination (metallization) and the land.
- Component overhangs the end or side of the land.
- Component has less than three termination faces (metallization).

#### Figure 8-45 610D-08-036
**Defect - Class 3**
- Component size is larger than 1206.

---

**8.3.2.9.2 Chip Components – Rectangular or Square End Components – 1, 3 or 5 Side Terminations, Termination Variations - Mounting Upside Down**

#### Figure 8-46 610D-08-037
**Target - Class 1, 2, 3**
- Element of chip component with exposed deposited electrical element is mounted away from the board.

#### Figure 8-47 610D-08-038
**Acceptable - Class 1**
**Process Indicator - Class 2, 3**
- Element of chip component with exposed deposited electrical element is mounted toward the board.

---

**8.3.2.9.3 Chip Components – Rectangular or Square End Components – 1, 3 or 5 Side Terminations, Termination Variations – Stacking**

These criteria are applicable when stacking is a requirement.

When stacking components, the top termination area of a component becomes the land for the next higher component.

Stacking order of mixed component types, e.g. capacitors, resistors, needs to be established by design.

#### Figure 8-48 610D-08-039
**Acceptable - Class 1, 2, 3**
- When permitted by drawing.
- **Stacking order meet drawing requirements.**
- All Stacked components meet the criteria of Table 8-2, features B through W, for the applicable class of acceptance.
- Side overhang does not preclude formation of required solder fillets.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

**Defect - Class 1, 2, 3**
- Stacked *part-components* when not required by drawing.
- Stacking order does not meet drawing requirements.
- All *Stacked* components do not meet the criteria of Table 8-2, features D through W, for the applicable class of acceptance.
- Side overhang precludes formation of required solder fillets.

8.3.2.9.4 Chip Components – Rectangular or Square End Components – 1, 3 or 5 Side Terminations, Termination Variations – Tombstoning

Figure 8-49 610D-08-040
Figure 8-50 610D-08-041

8.3.2.10 Chip Components – Rectangular or Square End Components – 1, 3 or 5 Side Terminations, Termination Variations – 3 terminations

These criteria are also applicable to cylindrical chip components with side terminations (Figure 8-52).

8.3.2.10.1 Chip Components – Rectangular or Square End Components – 1, 3 or 5 Side Terminations, Termination Variations – 3 terminations – Solder Width

Figure 8-51 new

**Target - Class 1, 2, 3**
- End joint width is equal to component termination width or width of land, whichever is less.

**Acceptable - Class 1, 2**
- End joint width is minimum 50% of component termination width or 50% land width, whichever is less.

**Acceptable - Class 3**
- End joint width is minimum 75% of component termination or 75% land width, whichever is less

**Defect - Class 1, 2, 3**
- Less than minimum acceptable end joint width.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

### 8.3.2.1.0.2 Chip Components – Rectangular or Square End Components – 1, 3 or 5 Side Terminations, Termination Variations – 3 terminations – Minimum Fillet Height

<table>
<thead>
<tr>
<th>Acceptable - Class 1, 2, 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Wetting is evident on the vertical surface(s) of the component termination.</td>
</tr>
</tbody>
</table>

**Figure 8-52 new**

</tr>
</thead>
<tbody>
<tr>
<td>• No fillet height evident on face of component.</td>
</tr>
<tr>
<td>• A wetted fillet is not evident.</td>
</tr>
</tbody>
</table>

### 8.3.3.3 Cylindrical End Cap (MELF) – Termination

This component is sometimes referred to as MELF (Metal Electrode Leadless Face). Solder connections to components having cylindrical end cap terminations must meet the dimensional and solder fillet requirements for each product classification. 8.3.2.10 has criteria for cylindrical components that also have side terminations (Figure 8-52).

#### Table 8-3 Dimensional Criteria - Cylindrical End Cap (MELF) – Termination

<table>

<td>W</td>
<td>Note 3</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Note 1.** Does not violate minimum electrical clearance.

**Note 2.** (C) is measured from the narrowest side of the solder fillet.

**Note 3.** Unspecified dimension, determined by design. Unspecified dimension, or variable in size as determined by design.

**Note 4.** Wetting is evident.

**Note 5.** The maximum fillet may overhang the land or extend onto the top of the component termination; however, the solder does not extend further onto the component body.

**Note 6.** Does not apply to components with end-only terminations.

**Note 7.** Designs with via in pad may preclude meeting those criteria. Solder acceptance criteria should be defined between the user and the manufacturer.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

### 8.3.3.1 Cylindrical End Cap Termination, Side Overhang (A)

<table>
<thead>
<tr>

</tbody>
</table>

<table>
<thead>
<tr>
<th>Figure 8-60 610D-08-049</th>
<th>Defect - Class 2, 3</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• End joint width (C) is less than 50% component diameter (W), or land width (P), whichever is less.</td>
</tr>
</tbody>
</table>
### 8.3.3.4 Cylindrical End Cap Termination, Side Joint Length (D)

**Target - Class 1, 2, 3**
- Side joint length (D) is equal to the length of component termination (R) or land length (S) whichever is less.

**Acceptable - Class 1**
- Side joint length (D) exhibits a wetted fillet.

**Acceptable - Class 2**
- Side joint length (D) is minimum 50% length of component termination (R) or land length (S) whichever is less.

**Acceptable - Class 3**
- Side joint length (D) is minimum 75% length of component termination (R) or land length (S) whichever is less.

**Defect - Class 1**
- Side joint length (D) does not exhibit a wetted fillet.

**Defect - Class 2**
- Side joint length (D) is less than 50% length of component termination (R) or land length (S) whichever is less.

**Defect - Class 3**
- Side joint length (D) is less than 75% length of component termination (R) or land length (S) whichever is less.

### 8.3.3.5 Cylindrical End Cap Termination, Maximum Fillet Height (E)

**Acceptable - Class 1, 2, 3**
- Maximum fillet height (E) may overhang the land and/or extend onto the top of the end cap metallization, but not extend further onto the component body.

**Defect - Class 1, 2, 3**
- Solder fillet extends onto the component body top.
8.3.3.6 Cylindrical End Cap Termination, Minimum Fillet Height (F)

**Figure 8-65 610D-08-054**

Acceptable - Class 1, 2
- Minimum fillet height (F) exhibits wetting.

**Figure 8-66 610D-08-055**

Acceptable - Class 3
- Minimum fillet height (F) is solder thickness (G) plus 25% diameter (W) of the component end cap or 1.0 mm [0.039 in], whichever is less.

**Figure 8-67 610D-08-056**

Defect - Class 1, 2, 3
- Minimum fillet height (F) does not exhibit wetting.

**Defect - Class 3**
- Minimum fillet height (F) is less than the solder thickness (G) plus 25% diameter (W) of the component end cap or 1.0 mm [0.039 in], whichever is less.

8.3.3.7 Cylindrical End Cap Termination, Solder Thickness (G)

**Figure 8-68 610D-08-057**

Acceptable - Class 1, 2, 3
- Wetted fillet evident.

**Defect – Class 1, 2, 3**
- No wetted fillet.

8.3.3.8 Cylindrical End Cap Termination, End Overlap (J)

**Figure 8-69 610D-08-058**

Acceptable - Class 1
- Wetted fillet is evident.

Acceptable - Class 2
- End overlap (J) between the component termination and the land is minimum 50% the length of component termination (R).

Acceptable - Class 3
- End overlap (J) between the component termination and the land is minimum of 75% the length of component termination (R).
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

**Defect - Class 1, 2, 3**
- Component termination area and land do not overlap.

**Defect - Class 2**
- End overlap (J) is less than 50% of the length of component termination (R).

**Defect - Class 3**
- End overlap (J) is less than 75% of the length of component termination (R).

### 8.3.4.2.4 Castellated Terminations

Connections formed to castellated terminations of leadless chip components must meet the dimensional and solder fillet requirements listed below for each product classification. The solder fillet may contact the bottom of the component.

<p>| Table 8-4 Dimensional Criteria - Castellated Terminations |</p>
<table>
<thead>
<tr>
<th>Feature</th>
<th>Dim.</th>
<th>Class 1</th>
<th>Class 2</th>
<th>Class 3</th>

<td>S</td>
<td>Note 2</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Castellation Width</td>
<td>W</td>
<td>Note 2</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Note 1.** Does not violate minimum electrical clearance.
**Note 2.** Unspecified dimension, or variable in size as determined by design.
**Note 3.** Wetting is evident.
**Note 4.** The maximum fillet may extend past the top of the castellation provided it does not contact the component body.

**Figure 8-71 610D-08-60**

**8.3.4.18.2.4.1 Castellated Terminations, Side Overhang (A)**

**Figure 8-72 610D-08-061**

**Target - Class 1, 2, 3**
- No side overhang.

**Acceptable - Class 1, 2**
- Maximum side overhang (A) is 50% castellation width (W).
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

**Acceptable - Class 3**
- Maximum side overhang (A) is 25% castellation width (W).

**Defect - Class 1, 2**
- Side overhang (A) exceeds 50% castellation width (W).

**Defect - Class 3**
- Side overhang (A) exceeds 25% castellation width (W).

</table>
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

8.3.4.4 Castellated Terminations, Minimum Side Joint Length (D)

Figure 8-76 610D-08-065

Acceptable - Class 1
- Wetted fillet evident.

Acceptable - Class 1, 2, 3
- Solder extends from the back of the castellation onto the land at or beyond the edge of the component.

Defect - Class 1, 2, 3
- Wetted fillet not evident.
- Solder does not extend from the back of the castellation onto the land at or beyond the edge of the component.

8.3.4.5 Castellated Terminations, Maximum Fillet Height (E)

Figure 8-77 610D-08-066

Figure 8-78 New

Acceptable – Class 1, 2, 3
- The fillet extends to the top of the castellation.
- The maximum fillet may extend past the top of the castellation provided it does not extend onto the component body.

Defect – Class 1, 2, 3
- Solder fillet violates minimum electrical clearance.
- Solder extends past the top of the castellation onto the component body.

Note: There is no maximum fillet height defect.

8.3.4.6 Leadless Chip Carriers with Castellated Terminations, Minimum Fillet Height (F)

Figure 8-79 610D-08-067

Acceptable - Class 1
- A wetted fillet is evident.

Acceptable - Class 2
- Minimum fillet height (F) is the solder thickness (G) (not shown) plus 25% castellation height (H).

Acceptable - Class 3
- Minimum fillet height (F) is the solder thickness (G) (not shown) plus 50% castellation height (H).
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

**Figure 8-80 NEW**

**Defect - Class 1**
- A wetted fillet is not evident.

**Defect - Class 2**
- Minimum fillet height (F) is less than solder thickness (G) (not shown) plus 25% castellation height (H).

**Defect - Class 3**
- Minimum fillet height (F) is less than solder thickness (G) (not shown) plus 50% castellation height (H).

</table>

**Note 1.** Does not violate minimum electrical clearance.

**Note 2.** Unspecified dimension, or variable in size as determined by design.

**Note 3.** Wetting is evident.

**Note 4.** See 8.2.8.3.5.5

**Note 5.** In the case of a toe-down lead configuration, the minimum heel fillet height (F) extends at least to the mid-point of the outside lead bend.

**Note 6.** Fine pitch leads (component terminations on less than 0.65 mm [0.025 in] centers as defined by IPC-T-50) require a minimum side fillet length of 0.5mm [0.02 in].
8.3.5.1 8.2.5.1 Flat Gull Wing Leads, Side Overhang (A)

Figure 8-81 610D-08-068  
Target - Class 1, 2, 3  
• No side overhang.

Figure 8-82 610D-08-069  
Acceptable - Class 1, 2  
• Maximum overhang (A) is not greater than 50% lead width (W) or 0.5 mm [0.02 in], whichever is less.

Figure 8-83 610D-08-070  
Acceptable - Class 3  
• Maximum overhang (A) is not greater than 25% lead width (W) or 0.5 mm [0.02 in], whichever is less.

Figure 8-84 610D-08-071  
Defect - Class 1, 2  
• Side overhang (A) is greater than 50% lead width (W) or 0.5 mm [0.02 in], whichever is less.

Figure 8-85 610D-08-072  
Defect - Class 3  
• Side overhang (A) is greater than 25% lead width (W) or 0.5 mm [0.02 in], whichever is less.

8.3.5.2 8.2.5.2 Flat Gull Wing Leads, Toe Overhang (B)

Figure 8-88 610D-08-075  
Acceptable - Class 1, 2, 3  
• Toe overhang does not violate minimum electrical clearance.

Defect - Class 1, 2, 3  
• Toe overhang violates minimum electrical clearance.

8.3.5.3 8.2.5.3 Flat and Gull Wing Leads, Minimum End Joint Width (C)

Figure 8-89 610D-08-076  
Target - Class 1, 2, 3  
• End joint width is equal to or greater than lead width.

Figure 8-90 610D-08-077  
Acceptable - Class 1, 2  
• Minimum end joint width (C) is 50% lead width (W).

Figure 8-91 610D-08-078  
Acceptable - Class 3  
• Minimum end joint width (C) is 75% lead width (W).
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

**8.3.5.4 Flat Gull Wing Leads, Minimum Side Joint Length (D)**

**Defect - Class 1, 2**
- Minimum end joint width (C) is less than 50% lead width (W).

**Defect - Class 3**
- Minimum end joint width (C) is less than 75% lead width (W).

**Target - Class 1, 2, 3**
- Evidence of wetted fillet along full length of lead foot.

**Acceptable - Class 1**
- Minimum side joint length (D) is equal to lead width (W) or 0.5 mm [0.02 in], whichever is less (not shown).

**Acceptable - Class 2, 3**
- When foot length (L) is less than three (W), (D) is equal to 100% (L), Figure 8-96.
- When foot length (L) is greater than three (W), minimum side joint length (D) is equal to or greater than three lead widths (W), Figure 8-97.

**Defect - Class 1**
- Minimum side joint length (D) is less than the lead width (W) or 0.5 mm [0.02 in], whichever is less.

**Defect - Class 2, 3**
- When foot length (L) is greater than three (W), minimum side joint length (D) is less than three lead widths (W) or 75% (L), whichever is longer.
- When foot length (L) is less than three (W), (D) is less than 100% (L).
8.3.5.5 Flat Gull Wing Leads, Maximum Heel Fillet Height (E)

In the following criteria, the words “plastic component” are used in the generic sense to differentiate between plastic components and those made of other materials, e.g., ceramic/alumina or metal (normally hermetically sealed).

**Figure 8-99 610D-08-086**

**Target - Class 1, 2, 3**
- Heel fillet extends above lead thickness but does not fill upper lead bend.
- Solder does not contact the component body.

**Figure 8-100 610D-08-087**

**Acceptable – Class 1, 2, 3**
- Solder touches a plastic SOIC or SOT component.
- Solder does not touch ceramic or metal component.

**Figure 8-101 610D-08-088**

**Acceptable - Class 1**
- A wetted fillet is evident.

**Defect – Class 2, 3**
- Solder touches the body of a plastic component, except for SOICs and SOTs.
- Solder touches the body of a ceramic or metal component.

8.3.5.6 Flat Gull Wing Leads, Minimum Heel Fillet Height (F)

**Target – Class 1, 2, 3**
- Heel fillet height (F) is greater than solder thickness (G) plus lead thickness (T) but does not extend into knee bend radius.

**Figure 8-103 610D-08-090**

**Acceptable - Class 1**
- A wetted fillet is evident.

**Figure 8-104 610D-08-091**

**Acceptable - Class 2**
- Where (T) is equal to or less than 0.38 mm [0.0149 in], the minimum heel fillet is (G) + (T).
- Where (T) is greater 0.38 mm [0.0149 in], the minimum heel fillet is (G) + 50% (T).
- Minimum heel fillet height (F) is equal to solder thickness (G) plus 50% lead thickness (T) at connection side.

**Figure 8-105 610D-08-092**

**Acceptable - Class 3**
- Minimum heel fillet height (F) is equal to solder thickness (G) plus lead thickness (T) at connection side.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

**Acceptable - Class 1, 2, 3**
- In the case of a toe-down configuration (not shown), the minimum heel fillet height (F) extends at least to the mid-point of the outside lead bend.

**Defect - Class 1**
- A wetted fillet is not evident.

**Defect - Class 2**
- Where (T) is equal to or less than 0.38 mm [0.0149 in], the minimum heel fillet is less than (G) + (T).
- Where (T) is greater than 0.38 mm [0.0149 in], the minimum heel fillet is less than (G) + 50% (T).
- Minimum heel fillet height (F) is less than solder thickness (G) plus 50% lead thickness (T) at connection side.

**Defect - Class 3**
- Minimum heel fillet height (F) is less than solder thickness (G) plus lead thickness (T) at connection side.

**Defect - Class 1, 2, 3**
- In the case of a toe-down configuration, the minimum heel fillet height (F) does not extend at least to the mid-point of the outside lead bend.

</table>

**Note 1.** Does not violate minimum electrical clearance.

**Note 2.** Unspecified dimension, determined by design.

**Note 3.** Wetting is evident.

**Note 4.** See 8.2.8.3.6.5

**Note 5.** In the case of a toe-down lead configuration, the minimum heel fillet height (F) extends at least to the mid-point of the outside lead bend.

### 8.3.6.1 Round or Flattened (Coined) **Gull Wing** Leads, Side Overhang (A)

**Figure 8-110 610D-08-096**

**Target - Class 1, 2, 3**
- No side overhang.

**Acceptable - Class 1, 2**
- Side overhang (A) is not greater than 50% lead width/diameter (W), or 0.5 mm [0.02 in], whichever is less.

**Acceptable - Class 3**
- Side overhang (A) is not greater than 25% lead width/diameter (W) or 0.5 mm [0.02 in], whichever is less.

**Defect - Class 1, 2**
- Side overhang (A) is greater than 50% lead width/diameter (W), or 0.5 mm [0.02 in], whichever is more.

**Defect - Class 3**
- Side overhang (A) is greater than 25% lead width/diameter (W), or 0.5 mm [0.02 in], whichever is more.
8.3.6.2 Round or Flattened (Coined) Gull Wing Leads, Toe Overhang (B)

Figure 8-111 610D-08-097

Acceptable - Class 1, 2, 3
• Toe overhang (B) is not specified.
• Does not violate minimum electrical clearance.

Defect - Class 1, 2, 3
• Toe overhang violates minimum electrical clearance.

8.3.6.3 Round or Flattened (Coined) Gull Wing Leads, Minimum End Joint Width (C)

Figure 8-112 610D-08-098

Target - Class 1, 2, 3
• End joint width (C) is equal to or greater than lead width/diameter (W).

Acceptable - Class 1, 2
• Wetted fillet is evident.

Acceptable - Class 3
• End joint width (C) is minimum 75% lead width/diameter (W).

Defect - Class 1, 2
• No evidence of wetted fillet.

Defect - Class 3
• Minimum end joint width (C) is less than 75% lead width/diameter (W).

8.3.6.4 Round or Flattened (Coined) Gull Wing Leads, Minimum Side Joint Length (D)

Figure 8-113 610D-08-099

Acceptable - Class 1, 2
• Side joint length (D) is equal to lead width/diameter (W).

Acceptable - Class 3
• Minimum side joint length (D) is equal to 150% lead width/diameter (W).

Defect - Class 1, 2
• Side joint length (D) is less than lead width/diameter (W).

Defect - Class 3
• Minimum side joint length (D) is less than 150% the lead width/diameter (W).
8.3.6.5 Round or Flattened (Coined) Gull Wing Leads, Maximum Heel Fillet Height (E)

In the following criteria, the words "plastic component" are used in the generic sense to differentiate between plastic components and those made of other materials, e.g., ceramic/alumina or metal (normally hermetically sealed).

**Figure 8-114 610D-08-100**

**Target – Class 1, 2, 3**
- Heel fillet extends above lead thickness but does not fill upper lead bend.
- Solder does not contact the component body.

**Acceptable - Class 1, 2, 3**
- Solder touches the body of a plastic SOIC or SOT component.
- Solder does not touch body of ceramic or metal component.

**Defect - Class 1**
- A wetted fillet is not evident.

**Acceptable – Class 1**

**Defect - Class 2, 3**
- Solder touches the body of a plastic component, except for SOICs and SOTs.
- Solder touches the body of ceramic or metal component.

**Defect - Class 1, 2, 3**
- Solder is excessive so that the minimum electrical clearance is violated.

---

8.3.6.6 Round or Flattened (Coined) Gull Wing Leads, Minimum Heel Fillet Height (F)

**Acceptable - Class 1, 2, 3**
- In the case of a toe-down configuration (not shown), the minimum heel fillet height (F) extends at least to the mid-point of the outside lead bend.

**Acceptable - Class 1**
- A wetted fillet is evident.

**Acceptable - Class 2**
- Minimum heel fillet height (F) is equal to solder thickness (G) plus 50% thickness of lead at joint side (T).

**Acceptable - Class 3**
- Minimum heel fillet height (F) is equal to solder thickness (G) plus thickness of lead at joint side (T).
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

Defect - Class 1
- A wetted fillet is not evident.

Defect - Class 2
- Minimum heel fillet height (F) is less than solder thickness (G) plus 50% thickness of lead at joint side (T).

Defect - Class 3
- Minimum heel fillet height (F) is less than solder thickness (G) plus thickness of lead at joint side (T).

Defect - Class 1, 2, 3
- In the case of a toe-down configuration, the minimum heel fillet height (F) does not extend at least to the mid-point of the outside lead bend.

### 8.3.6.9 Round or Flattened (Coined) Gull Wing Leads, Coplanarity

**Defect - Class 1, 2, 3**
- Component lead(s) out of alignment (coplanarity) preventing the formation of an acceptable solder connection. One lead or series of leads on component is out of alignment and fails to make contact with the land.

### 8.3.7 J Leads

Connections formed to leads having a J shape at the connection site shall meet the dimensional and fillet requirements listed below for each product classification.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Class I</th>
<th>Class 2</th>
<th>Class 3</th>
</tr>

</table>

**Note 1.** Does not violate minimum electrical clearance.

**Note 2.** Unspecified dimension, or variable in size as determined by design.

**Note 3.** Wetting is evident.

**Note 4.** Solder does not touch package body.

### 8.3.7.1 J Leads, Side Overhang (A)

**Target - Class 1, 2, 3**
- No side overhang.

**Acceptable - Class 1, 2**
- Side overhang (A) equal to or less than 50% lead width (W).

**Acceptable - Class 3**
- Side overhang (A) equal to or less than 25% lead width (W).

**Defect - Class 1, 2**
- Side overhang exceeds 50% lead width (W).

**Defect - Class 3**
- Side overhang exceeds 25% lead width (W).
### 8.3.7.2 J Leads, Toe Overhang (B)

<table>
<thead>
<tr>

<td>No wetted fillet.</td>
</tr>
</tbody>
</table>
8.3.7.8 SMT Soldering Anomalies, J Leads - Coplanarity

Component lead(s) out of alignment (coplanarity) preventing the formation of an acceptable solder connection. One lead or series of leads on component is out of alignment and fails to make contact with the land.

8.3.8 Butt/I Connections

Connections formed to leads positioned perpendicular to a circuit land in a butt configuration shall meet dimensional and solder fillet requirements in Table 8-8. Post assembly acceptability evaluations should consider the inherent limitation of this component mounting technique to survive operational environments when compared to footed leads or through hole mounting.

For Class 1 and 2 product, leads not having wettable sides by design (such as leads stamped or sheared from pre-plated stock) are not required to have side fillets. However the design should permit easy inspection of wetting to the wettable surfaces.

Butt connections are not permitted for Class 3 products.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Dim.</th>
<th>Class 1</th>
<th>Class 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum Side Overhang</td>
<td>A</td>
<td>25% (W) Note 1</td>

<td>Note 2</td>
<td></td>
</tr>
</tbody>
</table>

Note 1. Does not violate minimum electrical clearance.

Note 2. Unspecified dimension, determined by design. Unspecified dimension, or variable in size as determined by design.

Note 3. Wetting is evident.

Note 4. Maximum fillet may extend into the bend radius. Solder does not touch package body.

8.3.8.1 Butt/I Connections, Maximum Side Overhang (A)

Target - Class 1, 2
- No side overhang.

Acceptable - Class 1
- Overhang (A) less than 25% lead width (W).

Defect - Class 1
- Overhang (A) exceeds 25% lead width (W).

Defect - Class 2
- Any side overhang (A).
8.3.8.2 Butt/I Connections, Maximum Toe Overhang (B)

Figure 12-142 610D-08-128

Defect - Class 1, 2
- Any toe overhang (B).

8.3.8.3 Butt/I Connections, Minimum End Joint Width (C)

Figure 8-143 610D-08-129

Target - Class 1, 2
- End joint width (C) is greater than 100% of lead width (W).

Acceptable - Class 1, 2
- End joint width (C) is minimum 75% lead width (W).

Defect - Class 1, 2
- End joint width (C) is less than 75% lead width (W).

8.3.8.4 Butt/I Connections, Minimum Side Joint Length (D)

Figure 8-144 610D-08-130 modified

Acceptable - Class 1, 2
- Minimum side joint length (D) is not a specified parameter.

8.3.8.5 Butt/I Connections, Maximum Fillet Height (E)

Figure 8-145 610D-08-131

Acceptable - Class 1, 2
- Wetted fillet evident.

Defect - Class 1, 2
- No wetted fillet.
- Solder touches package body.

8.3.8.6 Butt/I Connections, Minimum Fillet Height (F)

Figure 8-146 610D-08-132

Acceptable - Class 1, 2
- Fillet height (F) is minimum 0.5 mm [0.02 in].

Defect - Class 1, 2
- Fillet height (F) is less than 0.5 mm [0.02 in].
8.3.8.7 Butt/I Connections, Solder Thickness (G)

### Figure 8-147 610D-08-133

**Acceptable - Class 1, 2**
- Wetted fillet evident.

**Defect – Class 1, 2**
- No wetted fillet.

8.3.9.2.9 Flat Lug Leads

Connections formed to the leads of power dissipating components with flat lug leads shall meet the dimensional requirements of Table 8-9 and Figure 8-149. The design should permit easy inspection of wetting to the wettable surfaces. Non-conformance to the requirements of Table 8-9 is a defect.

#### Table 8-9 Dimensional Criteria - Flat Lug Leads

<td></td>
</tr>
</tbody>
</table>

**Note 1.** Does not violate minimum electrical clearance.
**Note 2.** Unspecified parameter or variable in size as determined by design.
**Note 3.** Wetted fillet is evident.
**Note 4.** Where the lug is intended to be soldered beneath the component body and the land is designed for the purpose, the lead show evidence of wetting in the gap M.

### Figure 8-148 610D-08-134

### Figure 8-149 610D-08-135

**Defect – Class 1, 2, 3**
- Side overhang does not meet Table 8-9.
8.3.10.2.10 Tall Profile Components Having Bottom Only Terminations

Connections formed to the termination areas of tall profile components (component height is more than twice width or thickness, whichever is less) having bottom only terminations must meet the dimensional requirements of Table 8-10 and Figure 8-151. Non-conformance to the requirements of Table 8-10 is a defect.

Table 8-10 Dimensional Criteria - Tall Profile Components Having Bottom Only Terminations

<table>
<thead>
<tr>

</table>

Note 1. Does not violate minimum electrical clearance.
Note 2. Unspecified parameter or variable in size as determined by design.
Note 3. Wetting is evident.
Note 4. Solder does not contact the component body on the inside of the lead bend.
Note 5. Where a lead has two prongs, the joint to each prong is to meet all the specified requirements.
Note 6. Designs with via in land may preclude meeting these criteria. Solder acceptance criteria should be defined between the user and the manufacturer.

**Defect - Class 1,2,3**
- Insufficient fillet height.
- Insufficient end joint width (component turned on side, Figure 8-156).

### 8.12.2.12 Surface Mount Area Array

These criteria are intended to apply to devices with solder balls that collapse during reflow.

A **BGA Area array** criteria set defined herein assumes an inspection process is established to determine compliance for both X-Ray and normal visual inspection processes. To a limited extent, this may involve visual assessment, but more commonly requires evaluation of X-Ray images to allow assessment of characteristics that cannot be accomplished by normal visual means.

Process development and control is essential for continued success of assembly methods and implementation of materials. Non-conformance to the requirements of Tables 8-12, 13, and 14 are defects when visual inspection or X-Ray inspection is performed to verify product acceptance. Process validation can be used in lieu of X-ray/visual inspection provided objective evidence of compliance is available.

**BGA Area array** process guidance is provided in IPC-7095, which contains recommendations, based from extensive discussion of **BGA** process development issues.

**Note:** X-ray equipment not intended for electronic assemblies or not properly set up can damage sensitive components.

**Visual inspection requirements:**
- When visual inspection is the method used to verify product acceptance the magnification levels of Table 1-2 apply.
- The solder terminations on the outside row (perimeter) of the **BGA area array component** should be visually inspected whenever practical.
- The **area array component** **BGA** needs to align in both X & Y directions with the corner markers on the PCB (if present).
- Absence of **area array component leads**, e.g. **BGA** solder balls or columns, are defects unless specified by design.

**Note 1.** Does not violate minimum electrical clearance.
**Note 2.** Unspecified parameter or variable in size as determined by design.
**Note 3.** Wetting is evident.
**Note 4.** Not a visually inspectable attribute.
**Note 5.** Toe (end) surfaces are not required to be solderable. Toe fillets are not required. **H** = height of solderable surface of lead, if present. Some package configurations do not have a continuous solderable surface on the sides and do not require a toe (end) fillet.
**Note 6.** Acceptance criteria will need to be established between the manufacturer and user.

Figure 8-170 610D-08-147

Figure 8-171 610D-08-148

There are some package configurations that have no toe exposed or do not have a continuous solderable surface on the exposed toe on the exterior of the package (Figure 8-172 arrows) and a toe fillet will not form, see Figures 8-173 and 8-174.

Figure 8-172 610D-08-149

Figure 8-173 610D-08-150

Figure 8-174 610D-08-151

### 8.3.14.2.14 Components with Bottom Thermal Plane Terminations

These criteria are specific to any leaded or leadless packages that employs a soldered bottom thermal plane. One such example, shown here, is the D-Pak TO-252 (D-Pak™). Non-conformance to the requirements of Table 8-16 is a defect.

Criteria for non-visible thermal plane solder connections are not described in this document and shall will need to be established by agreement between the user and the manufacturer. The thermal transfer plane acceptance criteria are design and process related. Issues to consider include but are not limited to component manufacturer’s application notes, solder coverage, voids, solder height, etc. When soldering these types of components voiding in the thermal plane is common.

**Note:** The criteria for leads other than the thermal plane termination are provided in 8.2.5.
Table 8-16-14 Dimensional Criteria – Bottom Thermal Plane Terminations

**Note 1.** Acceptance criteria will need to be established between the manufacturer and user.

Figure 8-175 new

Figure 8-176 610D-08-152

**Target – Class 1, 2, 3**
- No thermal plane side overhang.
- Thermal plane termination edges have 100% wetting.

**Acceptable – Class 1, 2, 3**
- Thermal plane termination (A) side overhang is not greater than 25% of termination width.
- End joint width of the thermal plane end termination has 100% wetting to land in the contact area.

**Defect – Class 1, 2, 3**
- Side overhang of thermal plane termination is greater than 25% of termination width.
- End of thermal plane termination overhangs land.
- End joint width of the thermal plane end termination has less than 100% wetting to land in the contact area.

Figure 8-177 610D-08-153
8.3.15 Flattened Post Connections

This termination style is sometimes referred to as nail-head pin.

Criteria have not been established for Class 3 for this termination style. Process development and control is essential for continued success of assembly methods and implementation of materials.

Non-conformance to the requirements of Table 8-17 is a defect.

8.4 Specialized SMT Terminations

The IPC committee that maintains this standard has received requests to include a number of specialized SMT termination styles such as shown in Figures 8-180, 8-181 and 8-182. Often these termination styles are unique to a particular component or are specially made for a limited number of users. Before acceptance criteria can be developed there needs to be significant use so that a history of failure data can be captured from multiple users. Clause 1.4.1.7 of this standard is repeated here.

1.4.1.7 Specialized Designs IPC-A-610, as an industry consensus document, cannot address all of the possible components and product design combinations. Where uncommon or specialized technologies are used, it may be necessary to develop unique acceptance criteria. However, where similar characteristics exist, this document may provide guidance for product acceptance criteria. Often, unique definition is necessary to consider the specialized characteristics while considering product performance criteria. The development should include customer involvement or consent and for Class 3 the criteria shall include agreed definition of product acceptance.

Whenever possible these criteria should be submitted to the IPC Technical Committee to be considered for inclusion in upcoming revisions of this standard.

Figure 8-180 new

Figure 8-181 new

Figure 8-182 new

8-47
8.5 Surface Mount Connectors

These criteria apply to soldered connectors. For connector damage criteria see 9.5. The mounting and solder requirements for SMT connectors **shall** meet the criteria for the type of lead termination being used. There are no illustrations for these criteria.

**Target - Class 1, 2, 3**
- Connector is flush with board.

**Acceptable - Class 1, 2, 3**
- Back edge of connector is flush; entering edge of connector does not violate component height.
- Board lock is fully inserted/snapped through the board.
- Any tilt, provided:
  - Maximum height requirements are not exceeded.
  - Mates correctly.

**Defect - Class 1, 2, 3**
- Will not mate when used in application due to angle.
- Component violates height requirements.
- Boardlock is not fully inserted/snapped into board.

**Note:** Connectors need to meet form, fit and function requirements. A trial mating of connector to connector or to assembly may be required for final acceptance.

8.6 Jumper Wires

These criteria do not constitute authority for repair to assemblies without prior customer consent; see 1.1. This section establishes visual acceptability criteria for the installation of discrete wires (jumper wires, haywires, etc.) used to interconnect components where there is no continuous printed circuit.

The requirements relative to wire type, wire routing, staking and soldering requirements are the same for both haywires and jumper wires. For the sake of simplicity only the more common term, jumper wires, is used in this section; however these requirements would apply to both haywires and jumper wires.

Information concerning rework and repair can be found in IPC-7711/7721.

The following items are addressed:
- Wire selection; see 7.5.1
- Wire routing; see 7.5.2
- Adhesive staking of wire, see 7.5.3
- Solder termination, see 7.5.4 for through-hole jumper wire criteria, and 8.6.1 for SMT jumper wire criteria

They may be terminated in plated holes, and/or to terminal standoffs, conductor lands, and component leads.

Jumper wires are considered as components and are covered by an engineering instruction document for routing, termination, staking and wire type.

Keep jumper wires as short as practical and unless otherwise documented do not route over or under other replaceable components. Design constraints such as real estate availability and minimum electrical clearance need to be taken into consideration when routing or staking wires. A jumper wire 25 mm [0.984 in] maximum in length whose path does not pass over conductive areas and do not violate the designed spacing requirements may be uninsulated. Insulation, when required on the jumper wires, **shall** be compatible with conformal coating when conformal coating is required.
There is no adhesive on component bodies, leads or lands. Adhesive deposits do not obscure or interfere with solder connections.

For all lap solder connections described in this section the following conditions are acceptable:
- Insulation clearance does not permit shorting to noncommon conductors or violate minimum electrical clearance.
- Evidence of wetting of jumper wire and lead or the land.
- Wire contour or end is discernible in the solder connection.
- No fractures in solder connection.
- Wire overhang does not violate minimum electrical clearance.

Note: For applications of high frequency, i.e., RF, leads extending above the knee of the component could present problems.

**Target - Class 1, 2, 3**
- Lead is positioned parallel to longest dimension of the land.
- Solder fillet length equal to land width (P).

**Acceptable - Class 1,2,3**
- Wire to component termination-land solder connection length is at least 50% of land width (P) or twice the conductor diameter, whichever is greater.

**Defect - Class 1,2,3**
- Wire soldered on top of chip component termination.

**Figure 8-183 610D-11-043**

These criteria are applicable to jumpers attached to leads. See **8.6.1.5** for jumpers attached to lands.

**Figure 8-184 610D-11-044**

**Figure 8-185 610D-11-045**
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

Defect - Class 1,2,3
- Fractured solder connection.
- Wire to lead-land interface solder connection less than 75% of (L). Wire length and solder wetting is less than 75% from edge of land to knee of lead (L).
- Wire end extends past knee of bend.
- Wire violates minimum electrical clearance.

8.6.1.344.2.5.3 Jumper Wires - SMT - J Lead

These criteria are applicable to jumpers attached to leads. See 11.2.5.8.6.1.54 for jumpers attached to lands.

Target - Class 1, 2, 3
- Wire to lead-land interface solder connection is equal to (L).

Acceptable - Class 1,2,3
- Minimum length of the wire to lead-land interface solder connection is 75% of (L) (height of the J-lead).
- Wire length and solder wetting is equal to or more than 75% height of the J-lead (L).
- The wire end does not extend past the knee of the component lead.

Defect - Class 1,2,3
- Wire length and solder wetting is less than 75% height of the J-lead (L).
- Wire to lead-land interface solder connection is less than 75% of (L).
- The wire end extends past the knee of the component lead.
- Wire violates minimum electrical clearance.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

### 8.6.1.411.2.5.4 Jumper Wires - SMT – Castellations

These criteria are applicable to jumpers attached to castellation leads. See 11.2.5.58.6.1.5 for jumpers attached to lands.

**Figure 8-189**

**Acceptable - Class 1,2,3**
- Wire length and solder wetting is at least 75% top of land to top of castellation.
- Wire is placed against the back of the castellation.
- Wire does not extend above the top of the castellation.

**Defect - Class 1,2,3**
- Wire length and solder wetting is less than 75% top of land to top of castellation.
- Wire end extends past top of castellation.
- Wire violates minimum electrical clearance.

### 8.6.1.511.2.5.4 Jumper Wires - SMT - Vacant Land

These criteria are applicable to vacant lands or lands with leads attached.

**Figure 8-190 610D-11-049**

**Target - Class 1, 2, 3**
- Lead is positioned parallel to longest dimension of the land.
- Lead length and solder fillet equal to (P).

**Acceptable - Class 1,2,3**
- Minimum length of the wire to lead-land interface solder connection is 50% of (P) or 2D, whichever is less.
- For a land width (P) that is 6 mm (0.236 in) or larger, the wire to lead-land interface is at least 2 wire diameters.
- For a land width (P) less than 6 mm (0.236 in), the wire to lead-land interface is at least 50% of the land width or 2 wire diameter whichever is greater.

**Defect - Class 1,2,3**
- Wire to lead-land interface solder connection length is less than 50% of (P) or 2D, whichever is less.
- For a land width (P) that is 6 mm (0.236 in) or larger, the wire to lead-land interface is less than 2 wire diameter.
- For a land width (P) less than 6 mm (0.236 in), the wire to lead-land interface is less than 50% of the land width or 2 wire diameter whichever is greater.
- Wire violates minimum electrical clearance.
9 Component Damage

The following topics are addressed in this section:

9.1 Loss of Metallization & Leaching
9.2 Chip Resistor Element
9.3 Leaded/Leadless Devices
9.4 Ceramic Chip Capacitors
9.5 Connectors
9.6 Relays
9.7 Transformer Core Damage
9.8 Connectors, Handles, Extractors, Latches
9.9 Edge Connector Pins
9.10 Press Fit Pins
9.11 Backplane Connector Pins
9.12 Heat Sink Hardware

9.1 Loss of Metallization & Leaching

Acceptable - Class 1, 2, 3

• Leaching (Figures 9-1, 2) on any edge less than 25% of the component width (W) or the component thickness (T), Figure 9-3.

• Metallization loss on any termination side (not the end face) of a five-sided termination component, up to 25% of the component width (W) or the component thickness (T).

• Maximum of 50% of metallization loss of top metallization area (for each terminal end) of a three-sided termination component, Figures 9-1, 2.

Defect - Class 1, 2, 3

• Leaching of the terminal end face exposing the ceramic, Figure 9-4.

• Metallization loss on the terminal end face exposing the ceramic, Figure 9-3(1).

• Leaching exceeding 25% of component width (W) or component thickness (T), Figures 9-1 and 9-5.

• Metallization loss on any termination side (not the end face) on a five-sided termination component greater than 25% of component width (W) or component thickness (T), Figures 9-4 and 9-5.

• Metallization loss exceeds 50% of top area, Figures 9-5 and 9-6.

• Metallization loss greater than 50% of the top area on a three-sided termination component, Figures 9-5 and 9-6.

• Irregular shapes exceeding maximum or minimum dimensions for that component type, Figures 9-2, 9-3 and 9-6.
## 9.2 Chip Resistor Element

<table>

</tr>
</tbody>
</table>
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

Acceptable - Class 1

Process Indicator - Class 2, 3

- Indentations or chipouts on plastic body components do not enter lead seal or lid seals or expose an internal functional element, Figures 9-12, 13, 14.
- Component damage has not removed required identification.
- Component insulation/sleeving has damage provided that:
  - Damaged area shows evidence of increasing, e.g., rounded edges of the damage with no cracks, sharp corners, brittle material from heat damage, etc., Figures 9-13, 14.
  - Exposed component conductive surface provides no danger of shorting to adjacent components or circuitry, Figure 9-15.

Defect - Class 1, 2, 3

- Chip out or crack that enters the seal, Figure 9-16.
- There are cracks leading from the chipout on a ceramic body component, Figure 9-16.
- Enter into the seal, Figure 9-14.
- Exposes the lead in an area not normally exposed, Figure 9-14.
- Chip or crack that exposes the component substrate or active element, or affects hermeticity, integrity, form, fit, or function; Figures 9-17, 18, 19, 20, 21.
- There are cracks leading from the chipout on a ceramic body component, Figure 9-16.  
- Chips or cracks in glass body, Figures 9-21, 22.
- Cracked or damaged glass bead beyond part specification (not shown).
- Required identification is missing due to component damage, Figure 9-23.
- The insulating cover-coating is damaged to the extent that the internal functional element is exposed or the component shape is deformed (not shown), Figure 9-16.
- Damaged area shows evidence of increasing, e.g., from cracks, sharp corners, brittle material from heat, etc., Figure 9-24.
- Damage permits potential shorting to adjacent components or circuitry.
- Flaking, peeling, or blistering of plating.
9.4 Ceramic Chip Component Capacitors

**Figure 9-27 610D-09-021**

- Target - Class 1, 2, 3
  - No nicks, cracks, or stress fractures.

**Figure 9-28 610D-09-022**

- Acceptable - Class 1, 2
  - Nicks or chip-outs not greater than dimensions stated in Table 9-1, each considered separately.

**Table 9-1 Chip-Out Criteria**

</tbody>
</table>

**Acceptable - Class 1, 2, 3**
- Component color change due to thermal exposure in the reflow process.

**Figure 9-29 610D-09-023**

**Figure 9-30 610D-09-024**

- Defect - Class 1, 2, 3
  - Any nick or chip-out that exposes the electrodes.

**Figure 9-31 new**

- Any nick or chip-out in the termination area, or exposing an electrode.

**Figure 9-32 610D-09-026**

- Any cracks, nicks or any type of damage in glass bodied components.

**Figure 9-33 610D-09-028**

- Any chip-outs in resistive elements.
  - Any cracks or stress fractures.
  - Damage in excess of Table 9-1.

- Any nick, crack, chipout, or stress fracture.
9.5 Connectors

These criteria cover the plastic molded housings/shrouds which are used primarily as a guide for the mating connector. Connector pins are typically held by interference fit in a housing. The connector is inserted into a PCB and shrouds may be installed on the reverse side of the connector pins if required. Visual inspection of housings and shrouds includes physical damage such as cracks and deformation.

**Target – Class 1, 2, 3**
- No discernable physical damage.
- No burrs on housing/shroud.
- No cracks in housing/shroud.
- Connector/header pins are straight.

**Acceptable — Class 1, 2**
- Plastic burrs on housing but still attached (have not broken loose).
- Crack in noncritical area (does not impact integrity of the housing/shroud).

**Acceptable — Class 3**
- No cracks in housing/shroud.

**Acceptable — Class 1, 2, 3**
- Burrs on housing but still attached (have not broken loose) and do not affect form, fit or function.
- Cracks in noncritical areas (do not impact integrity of the housing/shroud).
- Minor scratches, chips, or thermal deformation that do not compromise protection of the contacts or interfere with proper mating.
- Pins are bent off center by 25% pin thickness/diameter or less.

**Defect – Class 1, 2, 3**
- Burrs, cracks or other deformations that impact the mechanical integrity or functionality of the housing.
- Pins are bent off center by more than 25% pin thickness/diameter.
- Cracks occurring at the sidewall to base interface.

**Acceptable — Class 1, 2, 3**
- No evidence of burn or char.
- Minor chips, scrapes, scratches or melting that does not affect form, fit or function.

**Process Indicator — Class 2, 3**
- Slight discoloration.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

**Defect - Class 1, 2, 3**
- Evidence of burning or charring.
- Changes in shape, chips, scrapes, scratches, melting or other damage that affect form, fit or function.

### 9.6 Relays

**Acceptable** - Class 1, 2, 3
- Minor scratches, cuts, chips, or other imperfections that do not penetrate the case or affect the seal (not shown).

**Defect** - Class 1, 2, 3
- Scratches, cuts, chips, or other imperfections that penetrate the case or affect the seal.
- The case is bulging or swollen.

### 9.7 Transformer Core Damage

**Acceptable** - Class 1, 2, 3
- Chips and/or scratches on exterior edges of core are permissible, providing they do not extend into core mating surfaces and do not exceed 1/2 the thickness of the core.

**Defect** - Class 1, 2, 3
- Chip in the core material is located on mating surface (arrow).
- Chip extending greater than 50% of the core thickness.
- Cracks in the core material.

### 9.8.4.2 Connectors, Handles, Extractors, Latches

This section shows some of the many different types of hardware mounted devices, e.g. connectors, handles, extractors and plastic molded parts. These devices need to be visually inspected for cracks and damage.

**Target** - Class 1, 2, 3
- No damage to part, printed board or securing hardware (rivets, screws, etc.).

**Acceptable** - Class 1
- Cracks in the mounted part extend no more than 50% of the distance between a mounting hole and a formed edge.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

**Defect - Class 1**
- Cracks in the mounted part extend more than 50% of the distance between a mounting hole and a formed edge.

**Defect - Class 2, 3**
- Cracks in mounted part.

**Defect - Class 1, 2, 3**
- Crack connects a mounting hole to an edge.
- Damage/stress to connector lead pins.

### 9.94.3.1 Connector Pins—Edge Connector Pins

<table>
<thead>
<tr>
<th>Acceptable - Class 1, 2, 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Contact is not broken or twisted.</td>

<tr>
<td>• Exposed basis metal.</td>
</tr>
<tr>
<td>• Burr.</td>
</tr>
</tbody>
</table>

**Defect—Class 1, 2, 3**
- Damaged pin (exposed basis metal).

**9.114.3.3 Connector Pins—Backplanes Connector Pins**

<table>
<thead>
<tr>
<th>Acceptable – Class 1, 2, 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Chip on non-mating surface of separable connector pin.</td>
</tr>
<tr>
<td>• Burnish on mating surface of separable connector pin, providing that plating has not been removed.</td>
</tr>
<tr>
<td>• Chip that encroaches the mating surface of separable connector pin which will not be in the mating connector contact wear path</td>
</tr>
</tbody>
</table>
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

**Defect – Class 1, 2, 3**
- Chipped pin on mating surface of separable connector, Figure 9-50.
- Scratched pin that exposes non-precious plating or basis metal.
- Missing plating on required areas.
- Burr on pin, Figure 9-51.
- Cracked PCB substrate.
- Pushed out barrel as indicated by copper protruding from bottom side of PCB.

### 9.12 Heat Sink Hardware

<table>
<thead>
<tr>

10 Printed Circuit Boards and Assemblies

This section is based on the requirements of IPC-A-600. For PCB anomalies not related to assembly caused damage refer to the applicable bare board specification criteria, e.g., IPC-6010 series, IPC-A-600, etc.

The following topics are addressed in this section:

10.1 Gold Fingers

10.2 Laminate Conditions
10.2.1 Measling and Crazing
10.2.2 Blistering and Delamination
10.2.3 Weave Texture/Weave Exposure
10.2.4 Haloing and Edge Delamination
10.2.5 Burns
10.2.6 Bow and Twist
10.2.7 Depanelization

10.3 Conductors/Lands
10.3.1 Reduction in Cross-Sectional Area
10.3.2 Lifted Pads/Lands
10.3.3 Mechanical Damage

10.4 Flexible and Rigid-Flex Printed Circuitry
10.4.1 Damage
10.4.2 Delamination
10.4.3 Discoloration
10.4.4 Solder Wicking
10.4.5 Attachment

10.5 Marking
10.5.1 Etched (Including Hand Printing)
10.5.2 Screened
10.5.3 Stamped
10.5.4 Laser
10.5.5 Labels
10.5.5.1 Bar Coding
10.5.5.2 Readability
10.5.5.3 Adhesion and Damage
10.5.5.4 Position
10.5.6 Using Radio Frequency Identification (RFID) Tags

10.6 Cleanliness
10.6.1 Flux Residues
10.6.2 Particulate Matter
10.6.3 Chlorides, Carbonates and White Residues
10.6.4 Flux Residues - No-Clean Process – Appearance
10.6.5 Surface Appearance

10.7 Solder Mask Coating
10.7.1 Wrinkling/Cracking
10.7.2 Voids, Blisters, Scratches
10.7.3 Breakdown
10.7.4 Discoloration

10.8 Conformal Coating
10.8.1 General
10.8.2 Coverage
10.8.3 Thickness

10.9 – Encapsulation
10.1 **Gold Surface Contact Area**

Gold Fingers

See IPC-A-600 and IPC-6010 (Series) for further criteria on gold fingers.

Inspection is typically accomplished without magnification or lighting aids. However, there may be instances where these aids are needed; e.g., pore corrosion, surface contamination.

Critical contact area (any portion of the gold areas (fingers, pins, surfaces) that contacts the mating surface of the connector) is dependent upon the connector system scheme being used by the manufacturer. The documentation should identify those particular dimensions.

**Figure 10-1 610D-10-001**

Target - Class 1, 2, 3
- No contamination on gold fingers surface contact areas.

**Figure 10-2 610D-10-002**

Acceptable - Class 1, 2, 3
- Solder is allowed in noncontact areas of fingers.

**Figure 10-3 new**

**Figure 10-4 610D-10-003**

Defect - Class 1, 2, 3
- Solder, any metal other than gold, or any other contamination in the critical contact area of the gold surface fingers, pins or other contact surfaces such as keyboard contacts.

**Figure 10-5 610D-10-004**

10.2 **Laminate Conditions**

The purpose of this section is to help the reader better understand the problem of recognizing laminate defects. In addition to providing detailed drawings and photographs to help identify common laminate defects, this section also provides acceptance criteria for the presence of measles on the board assembly.

This section is based on the requirements of IPC-A-600.<sup>10</sup> <sup><moved to 10 intro></sup>

**Note:** This document takes exception to the bare board measles criteria of some versions of IPC-A-600 and IPC-6012.

The identification of laminate defects can be confusing. To help identify defect conditions, please refer to the following pages where definitions, illustrations, and photographs have been provided that define and identify the following conditions and establish acceptance criteria:

- measling
- crazing
- blistering
- delamination
- weave texture
- weave exposure
- haloing

It is important to note that laminate defect conditions may become apparent when the fabricator receives the material from the laminator, or during the fabrication or assembly of the printed board.
10.2.1 Laminate Conditions - Measling and Crazing

This is an inherent condition in the laminate caused during processing the board or assembly.

Measling or crazing that occurs as a result of an assembly process (e.g., use of press fit pins, reflow soldering, etc.) will usually not increase.

Where measles are present that violate minimum electrical clearance, additional performance testing or dielectric resistance measurements may be required considering the product performance envelope; e.g., moisture environments, low atmosphere.

Where the substrate includes embedded components additional criteria may need to be defined.

**Measling** - An internal condition occurring in laminated base material in which the glass fibers are separated from the resin at the weave intersection. This condition manifests itself in the form of discrete white spots or crosses below the surface of the base material, and is usually related to thermally induced stress.

---

**Target - Class 1, 2, 3**
- No evidence of measling.

**Acceptable - Class 1, 2**
- The criteria for measling are that the assembly is functional.

**Acceptable - Class 2, 3**
- Measled areas in laminate substrates do not exceed 50% of the physical spacing between internal conductors.

**Process Indicator - Class 3**

**Defect - Class 3**
- Measled areas in laminate substrates exceed 50% of the physical spacing between internal conductors.

**Note:** This document takes exception to the bare board measling criteria of some versions of IPC-A-600 and IPC-6012.

**Note:** There are no defect criteria for measles. Measling is an internal condition which may not propagate under thermal stress and has not been conclusively shown to be a catalyst for conductive anodic filament CAF growth. Delamination is an internal condition which may propagate under thermal stress and may be a catalyst for CAF growth. The IPC-9691 user’s guide for CAF resistance testing and IPC-TM-650, Method 2.6.25, provide additional information for determining laminate performance regarding CAF growth. Users who wish to incorporate additional criteria for measles conditions may consider incorporating the provisions of IPC-6012 Class 3A which does not allow measles.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

**Crazing** - An internal condition occurring in laminated base material in which the glass fibers are separated from the resin at the weave intersections. This condition manifests itself in the form of connected white spots or crosses below the surface of the base material and is usually related to mechanically induced stress.

**Target - Class 1, 2, 3**
- No evidence of crazing.

**Acceptable - Class 1**
- The criteria for crazing are that the assembly is functional.

**Acceptable - Class 2,3**
- Crazed areas in laminate substrates do not exceed 50% of the physical spacing between noncommon conductors
- Crazing does not reduce spacing below minimum electrical clearance.

**Defect - Class 2,3**
- Crazed areas in laminate substrates exceed 50% of the physical spacing between internal conductors.
- Spacing is reduced below minimum electrical clearance.
- Crazing at the edge of the board reduces the minimum distance between board edge and conductive pattern, or more than 2.5 mm [0.0984 in] if not specified.

Figure 10-9 610D-10-007

Figure 10-10 610D-10-008
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

### 10.2.2 Laminate Conditions - Blistering and Delamination

In general, delamination and blistering occurs as a result of an inherent weakness of the material or process. Delamination or blistering between nonfunctional areas and functional areas may be acceptable provided that the imperfections are nonconductive and that other criteria are met.

**Blistering** - Delamination in the form of a localized swelling and separation between any of the layers of a lamination base material, or between base material and conductive foil or protective coating.

**Delamination** - A separation between plies within a base material, between a base material and a conductive foil or any other planar separation with a printed board.

**Target - Class 1, 2, 3**
- No blistering or delamination.

**Acceptable - Class 1, 2, 3**
- The blistering/delamination does not bridge more than 25% of the distance between plated-through holes or internal conductors.

**Defect - Class 1, 2, 3**
- Blister/delamination exceeds 25% of the distance between plated-through holes or internal conductors.
- The blistering/delamination reduces the space between conductive patterns below the minimum electrical clearance.

Note: Blisters or delamination areas may increase during assembly or operation. Separate criteria may need to be established.

### 10.2.3 Laminate Conditions - Weave Texture/Weave Exposure

**Weave Texture** - A surface condition of base material in which a weave pattern of glass cloth is apparent although the unbroken fibers are completely covered with resin.

**Acceptable - Class 1, 2, 3**
- Weave texture is an acceptable condition in all classes but is confused with weave exposure because of similar appearance.

Note: Microsection may be used as a reference for this condition.

**Weave Exposure** - A surface condition of base material in which the unbroken fibers of woven glass cloth are not completely covered by resin.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

**Figure 10-21 610D-10-019**

**Target - Class 1, 2, 3**
- No weave exposure.

**Acceptable - Class 1, 2, 3**
- Weave exposure does not reduce the spacing between conductive patterns below specification minimums.

**Defect - Class 1, 2, 3**
- Surface damage that cuts into laminate fibers.

**Defect - Class 1, 2, 3**
- Weave exposure reduces the spacing between conductive patterns to less than the minimum electrical clearance.

### 10.2.4 Laminate Conditions - Haloing and Edge Delamination

**Haloing** - A condition existing in the base material in the form of a light area around holes or other machined areas on or below the surface of the base material.

**Figure 10-22 610D-10-020**

**Target - Class 1, 2, 3**
- No haloing or edge delamination.
- No nicks/damage on smooth board edges.

**Acceptable - Class 1, 2, 3**
- Penetration of haloing or edge delamination does not reduce edge spacing more than 50% of that specified by drawing note or equivalent documentation. If none is specified, the distance from haloing or edge delamination to conductors is greater than 0.127mm (.005 inches). The maximum haloing or edge delamination is not greater than 2.5mm (0.0984 in).
- Board edges are rough but not frayed.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

**Defect - Class 1, 2, 3**

- Penetration of haloing or edge delamination, at board edges, holes or cut outs, reduces the unaffected distance from the edge to the closest conductive pattern by more than 50% of that specified, or to less than 0.127 mm (.005 inches) or extends more than 2.5mm (.0984 in) from the edge, whichever is less.
- Penetration of haloing, edge delamination (Figure 10-28) or routing (Figure 10-29) that reduces edge spacing more than 50% of that specified by drawing note or equivalent documentation. If none is specified, the distance from haloing or edge delamination to conductors is \( \geq 0.127 \text{mm (}.005 \text{ inches)} \). The maximum haloing or edge delamination is greater than 2.5mm (0.0984 in).
- Cracks in the laminate, see Figure 10-29 arrow.

### 10.2.5 Laminate Conditions – Pink Ring

There is no known evidence that pink ring affects functionality. The presence of excessive pink ring may be considered an indicator of process or design variation but is not a cause for rejection. The focus of concern is the quality of the lamination bond.

### 10.2.6 Burns

- Burns that physically damage surface or the assembly.

### 10.2.7 Laminate Conditions - Bow and Twist

**Figure 10-33 NEW**

**Acceptable – Class 1, 2, 3**

- Bow and twist does not cause damage during post solder assembly operations or end use. Consider “Form, Fit and Function” and product reliability.

**Defect – Class 1, 2, 3**

- Bow and twists causes damage during post solder assembly operations or end use *or affects form, fit or function.*
Note: Bow and twist after solder should not exceed 1.5% for through-hole and 0.75% for surface mount printed board applications (See IPC-TM-650, 2.4.22). It may be necessary to confirm through testing that bow and twist has not created stress that will result in solder connection fracture or component damage.

<table>

<tr>
<th>10.2.7 Laminate Conditions - Depanelization</th>
</tr>
</thead>
<tbody>
<tr>
<td>These criteria are applicable to PCAs with or without breakaway tabs. IPC-A-600 provides additional criteria for depanelization of bare boards.</td>
</tr>
</tbody>
</table>

Figure 10-35 new

Target – Class 1, 2, 3
- Edges are smooth with no burrs, nicks or haloing.

Figure 10-36 new

Acceptable – Class 1, 2, 3
- Edges are rough but not frayed.
- Nicks or routing do not exceed 50% of the distance from the board edge to the nearest conductor or 2.5 mm [0.098 in], whichever is less. See 10.2.4 for haloing and 10.2.1 for crazing.
- Edge conditions - loose burrs do not affect fit, form or function.

Figure 10-37 new

Defect – Class 1, 2, 3
- Edges are frayed.
- Nicks or routing exceed 50% of the distance from the board edge to the nearest conductor or 2.5 mm [0.098 in], whichever is less. See 10.2.4 for haloing and 10.2.1 for crazing.
- Edge conditions - loose burrs affect fit, form or function.

Figure 10-38 new

Figure 10-39 new

10.3.10.2.9 Laminate Conditions – Conductors/Lands

These criteria are applicable to conductors and lands on rigid, flex and rigid-flex circuitry.

IPC-6010 (Series) provides the requirements for conductor width and thickness reduction.

Conductor Imperfections – The physical geometry of a conductor is defined by its width x thickness x length. Any combination of defects does not reduce the equivalent cross-sectional area (width x thickness) of the conductor by more than 20% of the minimum value (minimum thickness x minimum width) for Class 2 and 3, and 30% of the minimum value for Class 1.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

**Conductor Width Reduction** – Allowable reduction of the conductor width (specified or derived) due to isolated defects (i.e., edge roughness, nicks, pinholes and scratches) does not exceed 20% of the minimum printed conductor width for Class 2 and 3, and 30% of the minimum printed conductor width for Class 1.

**Figure 10-43 610D-10-036**

<table>
<thead>
<tr>
<th>Defect - Class 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Reduction in minimum width of printed conductors by more than 30%.</td>
</tr>
<tr>
<td>• Reduction in minimum printed conductor width or length of lands by more than 30%.</td>
</tr>
</tbody>
</table>

</thead>
<tbody>
<tr>
<td>• Reduction in minimum width of printed conductors by more than 20%.</td>
</tr>
<tr>
<td>• Reduction in width or length of lands by more than 20%.</td>
</tr>
</tbody>
</table>

Note: Even small changes in cross-sectional area can have a large impact on impedance of RF circuitry. Alternate criteria may need to be developed.

**10.3.2 10.2.9.2 Laminate Conditions - Conductors/Lands – Lifted Pads/Lands**

When the outer, lower edge of land areas are lifted or separated more than the thickness (height) of the land. Except as noted, these criteria are for lifted pads/lands with or without a lead in the via/PTH.

**Figure 10-46 610D-10-038**

<table>
<thead>
<tr>
<th>Target – Class 1, 2, 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>• No separation between conductor, pad or PTH land and the laminate surface.</td>
</tr>
</tbody>
</table>

### 10.4 Flexible and Rigid-Flex Printed Circuitry

#### 10.4.1 Flexible and Rigid-Flex Printed Circuitry – Damage Nicks and Tears

The trimmed edge of the flexible printed circuit or the flexible section rigid-flex printed circuit is free of burrs, nicks, delamination, or tears in excess of that allowed in the procurement documentation. Minimum edge to conductor shall be specified in the procurement documentation.

The deformation of a stiffener board should conform to the master drawing or the individual specification.

**Note:** For SMT or through-hole component mounting, placement, soldering, cleanliness criteria on flex assemblies, etc. follow the applicable sections of this standard.

<table>
<thead>
<tr>
<th>Figure 10-54 610D-10-030</th>
<th>Target – Class 1, 2, 3</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Free of nicks, and tears, burns, charring or melting.</td>
</tr>
<tr>
<td></td>
<td>Minimum edge to conductor spacing maintained.</td>
</tr>
</tbody>
</table>

<table>
<thead>

</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Figure 10-56 610D-10-032</th>
<th>Acceptable - Class 1, 2, 3</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• No nicks or tears in excess of that specified in the procurement documentation.</td>
</tr>
<tr>
<td></td>
<td>• Edge to conductor spacing of the flexible portion is within requirements specified on the procurement documentation.</td>
</tr>
<tr>
<td></td>
<td>• Nicks or haloing along the edges of the flexible printed circuitry, cutouts, and unsupported holes, providing the penetration does not exceed 50% of the distance from the edge to the nearest conductor or 2.5 mm [0.0984 in], whichever is less.</td>
</tr>
<tr>
<td></td>
<td>• The area of blister or delamination between flex circuitry and a stiffener board does not exceed 20% of the joined area provided the thickness of the blister does not exceed the thickness limit of the entire board.</td>
</tr>
</tbody>
</table>
Defect – Class 1, 2, 3
- Nicks, tears, haloing or imperfections more than 50% of the distance from the edge to the nearest conductor or 2.5 mm [0.098 in], whichever is less, or in excess of that specified in the procurement documentation.
- Edge to conductor spacing does not comply with specified requirements.
- The area of blister or delamination between flex circuitry and a stiffener board exceeds 20% of the joined area.
- Evidence of burns, charring or melting of the insulation.

Note: Mechanically created indentions caused by contact between the coverlayer of flexible printed circuit boards or assemblies and molten solder are not rejectable. Additionally, care should be taken to avoid bending or flexing conductors during inspection.

10.4.2 Flexible and Rigid-Flex Printed Circuitry – Stiffener Board Delamination

Sometimes delamination takes place in the flex circuitry or between flex circuitry and the edge of a stiffener board during reflow, cleaning steps, etc. of assembly process.

Acceptable – Class 1, 2, 3
- The distance from stiffener board edge in the straight section is 0.5mm [0.0197 in] or less.
- The distance from stiffener board edge in the bend section is 0.3mm or less.
- Delamination (separation) or bubbles do not bridge conductors in the cover layers of the flexible circuitry.

Defect – Class 1, 2, 3
- The distance from stiffener board edge in the straight section exceeds 0.5mm [0.0197 in].
- The distance from stiffener board edge in the bend section exceeds 0.3mm [0.012 in].
- Delamination (separation) or bubbles bridges conductors in the cover layers of the flexible circuitry.

10.4.3 Flexible and Rigid-Flex Printed Circuitry – Discoloration

There are no illustrations for these criteria.

Acceptable – Class 1, 2, 3
- A discolored conductor meets the requirements of dielectric withstanding voltage, flexural fatigue resistance, bending resistance, and solder temperature resistance, after being subjected to the moisture resistance test of 40°C, 40% relative humidity, 96 hours.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

Acceptable – Class 1
- Minimum discoloration.

Defect – Class 1, 2, 3
- A discolored conductor does not meet the requirements of dielectric withstanding voltage, flexural fatigue resistance, bending resistance, or solder temperature resistance, after being subjected to the moisture resistance test of 40°C, 40% relative humidity, 96 hours.

10.4.4 Flexible and Rigid-Flex Printed Circuitry – Solder Wicking

---

**Target – Class 1, 2, 3**
- Solder or plating on land covers all exposed metal and stops at coverlayer.
  - **Solder wicking or plating migration does not extend into the bend or flex transition area.**

**Acceptable – Class 1, 2, 3**
- As agreed upon between user and supplier.
- Solder wicking or plating migration does not extend into the bend or flex transition area.
- **Meets conductor spacing requirements.**

**Acceptable – Class 2**
- Solder wicking/plating migration does not extend under coverlayer more than 0.5 mm [0.020 in].
- **Solder wicking or plating migration does not extend into the bend or flex transition area.**
- **Meets conductor spacing requirements.**

**Acceptable – Class 3**
- Solder wicking/plating migration does not extend under coverlayer more than 0.3 mm [0.012 in].
- **Solder wicking or plating migration does not extend into the bend or flex transition area.**
- **Meets conductor spacing requirements.**

**Defect – Class 2**
- Solder wicking/plating migration extends under coverlayer more than 0.5 mm [0.020 in].

**Defect – Class 3**
- Solder wicking/plating migration extends under coverlayer more than 0.3 mm [0.012 in].
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

**Defect - Class 1, 2, 3**
- Defects exceed above criteria.
  - Solder wicking or plating migration extends into the bend or flex transition area.
  - Spacing as a result of solder wicking or plating migration violate minimum electrical clearance.

### 10.4.5 Flexible and Rigid-Flex Printed Circuitry – Attachment

These criteria are applicable to the solder attachment of flex on PCB (FOB). When sufficient data has been collected this will be expanded to include flex on flex (FOF) and connection using anisotropically conductive flex (ACF).

**Target – Class 1, 2, 3**
- No side overhang.
- Plated through holes in the connection areas are filled 100%.
- Solder is fully wetted in edge semicircular plated holes.

**Acceptable – Class 1, 2, 3**
- Side overhang of flex termination is equal to or less than 20% of flex termination width.
- Plated through holes in the connection areas are filled 50% or more.
- Wetted solder is visible in the edge semicircular plated holes.

**Process Indicator – Class 1, 2, 3**
- No evidence of wetted solder in two adjacent edge semicircular plated holes.

**Defect – Class 1, 2, 3**
- Side overhang of flex termination is more than 20% of flex termination width.
- Plated through holes in the connection areas are less than 50% filled.
- No evidence of wetted solder in three or more adjacent edge semicircular plated holes.
Marking Acceptability Requirements

This section covers acceptability criteria for marking of printed boards and other electronic assemblies. Marking provides both product identification and traceability. It aids in assembly, in-process control, and field servicing. The methods and materials used in marking shall serve the intended purposes and shall be readable, durable, and compatible with the manufacturing processes and should remain legible through the life of the product.

Examples of the markings addressed by this section include the following:

a. Electronic Assemblies:
   - company logo
   - board fabrication part numbers and revision level
   - assembly part number, group number, and revision level
   - component legends including reference designators and polarity indicators (only applies prior to assembly processing/cleaning)
   - certain inspection and test traceability indicators
   - U.S. and other relevant regulatory agencies/certifications
   - unique individual serial number
   - date code

b. Modules and/or Higher Level Assemblies:
   - company logo
   - product identification numbers, e.g., drawing number, revision and serial number
   - installation and user information
   - relevant regulatory agencies’ certification labels

The fabrication and assembly drawings are the controlling documents for the locations and types of markings. Marking criteria specified in the drawings will take precedence over these criteria.

In general, additive markings over metal surfaces are not recommended. Markings which serve as aids to assembly and inspection need not be visible after the components are mounted.

Assembly marking (part numbers, serial numbers) need to remain legible (capable of being read and understood as defined by the requirements of this standard) after all tests, cleaning and other processes to which the item is subjected.

Component markings, reference designators and polarity indicators should be legible and components should be mounted in such a manner that markings are visible. However, unless otherwise required, it is an acceptable condition if these markings are removed or damaged during normal cleaning or processing. Where component marking visibility and legibility is desired, the requirement needs to be stated in procurement documentation.

Markings are not deliberately altered, obliterated, or removed by the manufacturer unless required by the assembly drawing(s)/documentation. Additional markings such as labels added during the manufacturing process should not obscure the original supplier's markings. Permanent labels need to comply with the adhesion requirements of 10.5.5.3. Components and fabricated parts need not be mechanically installed so that the reference designations are visible when installed.

Acceptance of the marking is based on using the unaided eye. Magnification, if used, is limited to 4X.

Radio Frequency Identification Marking (RFID) is widely used in industry. To facilitate this marking, RFID passive “tags” (readable from short distances – inches to several feet using low frequency; as compared to active “tags, – 125KHz to 915 MHz; no battery power required) or active “tags” (readable from longer distance – e.g., 30 ft or more using high frequency – 433 MHz to 2.45 GHz; self-contained battery powered) are used. These tags contain an electronic circuit (a microchip) that operates at the specified frequency. The RFID “tags” contain electronic data that may consist of any of the aforementioned marking information, as well as additional data provided for tracking/traceability purposes. For the RFID “tags” to function properly, it is important that the “tags” be physically located from the specified distance away from the “tag” reader. The RF signal must not be obstructed by
objects such as metal, water (depends on frequency), or any other object that would distort, or otherwise prevent proper transmission of the RF signal to the “tag” reader.

These criteria are applicable when content marking is required.

**Acceptable – Class 1, 2, 3**
- Markings include the content specified by the controlling document.

**Defect - Class 1, 2, 3**
- Marking content incorrect.
- Marking missing.

### 10.5.1 Marking - Etched (Including Hand Printing)

Hand printing may include marking with indelible pen or mechanical etcher.

**Figure 10-68 610D-10-044**

**Target - Class 1, 2, 3**
- Each number or letter is complete, i.e., none of the lines forming a character are missing or broken.
- Polarity and orientation markings are present and legible.
- Lines forming the character are sharply defined and uniform in width.
- Minimum spacing requirements between active conductors have also been maintained between etched symbolization and active conductors.

**Acceptable - Class 1, 2, 3**
- Edges of the lines forming a character may be slightly irregular. Open areas within characters may be filled providing the characters are legible and cannot be confused with another letter or number.
- Width of the lines forming a character may be reduced by up to 50% providing they remain legible.
- Lines of a number or letter may be broken provided the breaks do not make the marking illegible.

**Figure 10-69 610D-10-045**

**Acceptable - Class 1, 2, 3**
- Legends are irregularly formed but the general intent of the legend or marking is discernible.

**Defect - Class 1, 2, 3**
- Required marking not present or legible.
- Missing or illegible characters in the markings.
- Marking violates the minimum electrical clearance limits.
- Solder bridging within or between characters or characters/conductors preventing character identification.
- Lines forming a character are missing or broken to the extent that the character is not legible or is likely to be confused with another character.
10.5.2 10.3.2 Marking - Screened

**Target - Class 1, 2, 3**
- Each number or letter is complete i.e., none of the lines forming a character are missing or broken.
- Polarity and orientation markings are present and legible. Lines forming the character are sharply defined and uniform in width.
- Ink forming the markings is uniform, i.e., there are no thin spots or excessive build-ups.
- The open areas within characters are not filled (applies to numbers 0, 6, 8, 9, and letters A, B, D, O, P, Q, R).
- There are no double images.
- Ink is confined to the lines of the character, i.e., there are no smeared characters and the build-up of material outside the characters is held to a minimum.
- Ink markings may touch or cross over conductors but are no closer than tangent to a land required to have a solder fillet.

**Acceptable - Class 1, 2, 3**
- Ink may be built up outside the line of a character providing the character is legible.
- Marking ink on the land does not interfere with soldering requirements.

**Process Indicator - Class 2,3**
- Lines of a number or letter may be broken (or the ink thin over a portion of the character) providing the breaks do not make the markings illegible.

**Acceptable - Class 1**

**Process Indicator - Class 2,3**
- The open areas within characters may be filled providing the characters are legible, i.e., cannot be confused with another letter or number.

**Defect - Class 1, 2, 3**
- Marking ink is present on the land interfering with the solder requirements of Tables 7-43, 7-52-6 or 7-7, or with the surface mount soldering requirements of Section 8.

---

**Figure 10-71 610D-10-047**

**Defect - Class 1, 2, 3**
- Marking ink is present on the land interfering with the solder requirements of Tables 7-43, 7-52-6 or 7-7, or with the surface mount soldering requirements of Section 8.

---

0-16
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

**Acceptable - Class 1**

**Process Indicator - Class 2,3**
- Marking that is smeared or blurred but is still legible.
- Double images are legible.

**Defect - Class 1, 2, 3**
- Missing or illegible markings or reference designators for component location, or component outlines.
- Missing or illegible characters in the markings.
- Open areas of characters are filled and are not legible, or are likely to be confused with another number or letter.
- Lines forming a character are missing, broken or smeared to the extent that the character is not legible or is likely to be confused with another character.

**Marking - Stamped**

**Target - Class 1, 2, 3**
- Each number or letter is complete, i.e., none of the lines forming a character are missing or broken.
- Polarity and orientation markings are present and legible.
- Lines forming the character are sharply defined and uniform in width.
- Ink forming the markings is uniform, i.e., there are no thin spots or excessive build-ups.
- The open areas within characters are not filled (applies to numbers 0, 6, 8, 9 and letters A, B, D, O, P, Q, R).
- There are no double images.
- Ink is confined to the lines of the character, i.e., there are no smeared characters and the build-up of material outside the characters is held to a minimum.
- Ink markings may touch or cross over conductors but are no closer than tangent to a solderable land.

**Acceptable - Class 1, 2, 3**
- Ink may be built up outside the line of a character providing the character is legible.
- Marking ink is present on the land (see soldering requirements of Tables 7-4, 7-5 or 7-7, or the surface mount soldering requirements of Section 8).

**Acceptable - Class 1**

**Process Indicator - Class 2,3**
- Lines of a number or letter may be broken (or the ink thin over a portion of the character) providing the breaks do not make the markings illegible.
- The open areas within characters may be filled providing the characters are legible, i.e., cannot be confused with another letter or number.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

**Defect - Class 1, 2, 3**
- Marking ink is present on the land interfering with the solder requirements of Tables 7-4, 7-5 or 7-7, or with the surface mount soldering requirements of Section 8.

**Defect - Class 1, 2, 3**
- Missing or illegible characters in the markings.
- Open areas of characters are filled and are not legible, or are likely to be confused with another number or letter.
- Lines forming a character are missing, broken or smeared to the extent that the character is not legible or is likely to be confused with another character.

**Acceptable - Class 1**
**Process Indicator - Class 2, 3**
- Marking that has been smeared or blurred but is still legible.
- Double stamped markings are acceptable provided the general intent can be determined.
- Missing or smeared marking does not exceed 10% of the character and the character is still legible.

**Target - Class 1, 2, 3**
- Each number or letter is complete, and legible, i.e., none of the lines forming a character are missing or broken.
- Polarity and orientation markings are present and legible.
- Lines forming the character are sharply defined and uniform in width.
- Marking forming the characters is uniform, i.e., there are no thick or thin spots.
- The open areas within characters are not filled (applies to numbers 0, 6, 8, 9 and A, B, D, O, P, Q, R).
- Marking is confined to the lines of the character, i.e., do not touch or cross over solderable surfaces.
- The depth of the marking does not adversely affect the function of the part.
- There is no exposed copper when marking on the ground plane of printed circuitry boards.
- There is no delamination when marking on the printed circuit board dielectric.

**Acceptable - Class 1, 2, 3**
- Marking may be built up outside the line of a character providing the character is legible.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

Acceptable - Class 1

Process Indicator - Class 2, 3
- Multiple image is still legible.
- Missing marking is not more than 10% of the character.
- Lines of a number or letter may be broken (or thin over a portion of the character).

Defect - Class 1, 2, 3
- Missing or illegible characters in the markings.
- Open areas of characters are filled and are not legible, or are likely to be confused with another number or letter.
- Lines forming a character are missing, broken or smeared to the extent that the character is not legible or is likely to be confused with another character.
- The depth of the marking adversely affects the function of the part.
- Marking exposes copper on the ground plane of printed circuit boards.
- Delamination on the printed circuit board dielectric from marking.
- Markings touch or cross over solderable surfaces.

**10.5.5.1 Marking - Labels**

Permanent labels are commonly used to attach bar code data, but may include text. Readability, adhesion and damage criteria apply to all permanent labels.

**10.5.5.1.1 Marking - Labels – Bar Coding**

Bar coding has gained wide acceptance as a method of product identification, process control and traceability because of ease and accuracy of data collection and processing. Bar code labels are available which occupy small areas (some can be attached to the thickness edge of the PWB) and can withstand the normal wave soldering and cleaning operations. Bar coding can also be laser scribed directly on to the base material. Acceptability requirements are the same as other types of markings except for legibility where machine readability replaces human readability.

**10.5.5.2 Marking - Labels - Readability**

Target - Class 1, 2, 3
- No spots or voids on printed surfaces.

Acceptable - Class 1, 2, 3
- Spots or voids on printed surfaces of bar codes are permissible provided that either:
  - Bar code can be read successfully with three (3) or fewer attempts using a wand type scanner.
  - The bar code can be read successfully with two (2) or fewer attempts using a laser scanner.
- Text is legible.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

**Defect - Class 1, 2, 3**
- Bar code cannot be successfully read within three (3) attempts using a wand type scanner.
- Bar code cannot be read successfully within two (2) attempts using a laser scanner.
- Missing or illegible characters in the markings.

**10.5.5.3**

<table>
<thead>
<tr>
<th>10.5.5.310.3.5.3 Marking - Labels - Adhesion and Damage</th>
</tr>
</thead>
</table>

**Figure 10-81 NEW**

**Target - Class 1, 2, 3**
- Adhesion is complete, shows no sign of damage or peeling.

**Acceptable – Class 1, 2, 3**
- Label lifted 10% or less of the label area.

**Defect - Class 1, 2, 3**
- More than 10% of the label area is peeling.
- Missing labels.
- Label wrinkle affects readability.

**10.5.5.4**

<table>
<thead>
<tr>
<th>10.5.5.410.3.5.4 Marking - Labels – Position</th>
</tr>
</thead>
</table>

**Figure 10-82 610D-10-057**

**Acceptable – Class 1, 2, 3**
- Label is applied in the required position.

**Defect – Class 1, 2, 3**
- Label is not applied in the required position.

**10.5.6 Marking – Using Radio Frequency Identification (RFID) Tags**

As noted in 10.3, RFID “tags” are widely used by industry for numerous applications, including providing an electronic version of some of the same information historically applied to product via the previous marking methods described herein, as well as for inventory tracking and traceability purposes. The use of RFID “tags” is not limited to printed wiring boards; for example, RFID “tags” may be added to product packing containers, sides of beef in a meat packing plant, etc. RFID “tags” are used in conjunction with an electronic instrument that “reads” the radio frequency signal from the RFID “tag” and converts this signal to facilitate viewing (electronic and/or hard copy) of the data embedded in the “tag”. For the RFID system (RFID “tag” and associated reader) to work properly, the criteria specified below shall be met.

There are no illustrations for these criteria.
Target – Class 1, 2, 3
• The RFID “tag” is located within the specified distance from the “tag” reader such that the reader can access the RF signal.
• The free-air path between the RFID “tag” and the reader is free of obstructions (e.g., metal, water, etc.) that may preclude transmission of the RF signal from the “tag” to the reader.
• The RFID tag is attached to the object in a manner that will not preclude transmission of the RF signal.
• The RFID “tag” is not damaged to the extent that the information embedded therein can not be read by the reader.
• The RF signal is not distorted to the extent that the data cannot be clearly discerned using the reader.

Defect – Class 1, 2, 3
• The RFID “tag” is not located within the specified distance from the “tag” reader such that the reader cannot access the RF signal.
• The free-air path between the RFID “tag” contains obstructions (e.g., metal, water, etc.) that preclude transmission of the RF signal from the “tag” to the reader.
• The RFID tag is attached to the object in a manner that precludes transmission of the RF signal.
• The RFID “tag” is damaged to the extent that the information embedded therein cannot be read by the reader.
• The RF signal is distorted to the extent that the data cannot be clearly discerned using the reader.
10.6.4.4 Cleanliness - Flux Residues

The flux classification (see J-STD-004) and assembly process, i.e., no-clean, clean, etc., need to be identified and considered when applying these criteria.

**Figure 10-85 610D-10-060**

**Target - Class 1, 2, 3**
- Clean, no discernible residue.

**Acceptable - Class 1, 2, 3**
- No discernible residue from cleanable fluxes is allowed.
- Flux residues from no-clean processes may be allowed.

**Figure 10-86 610D-10-061**

**Defect - Class 1, 2, 3**
- Discernible residue from cleanable fluxes, or any activated flux residues on electrical contact surfaces.

Note 1. Class 1 may be acceptable after qualification testing. Check also for flux entrapment in and under components.

Note 2. Flux residue activity is defined in J-STD-001 and J-STD-004.

Note 3. Processes designated "no-clean" need to comply with end-product cleanliness requirements.
### 10.6.2 Cleanliness - Particulate Matter

**Figure 10-88 610D-10-062**

**Target - Class 1, 2, 3**
- Clean.

**Acceptable - Class 1, 2, 3**
- Particulate matter meets the following criteria:
  - Attached/entrapped/encapsulated on the PCA surface or solder mask.
  - Do not violate minimum electrical clearance.

**Defect - Class 1, 2, 3**
- Dirt and particulate matter on assembly, e.g., dirt, lint, dross, metallic particles, etc., see 5.2.6 for exceptions.
- Particulate matter that is not attached, entrapped, encapsulated, see 5.2.7.1 and 10.7.2.2.
- Violate minimum electrical clearance.

**Note:** Entrapped/encapsulated/attached is intended to mean that normal service environment of the product will not cause particulate matter to become dislodged.

### 10.6.3 Cleanliness - Chlorides, Carbonates and White Residues

**Figure 10-92 610D-10-066**

**Target - Class 1, 2, 3**
- No discernible residue.

**Figure 10-93 610D-10-067**

**Defect - Class 1, 2, 3**
- White residue on PWB surface.
- White residues on or around the soldered termination.
- Metallic areas exhibit crystalline white deposit.

**Note:** White residues resulting from no-clean or other processes are acceptable provided the residues from chemistries used have been qualified and documented as benign. See 10.4.10.6.4.

### 10.6.4 Cleanliness - Flux Residues - No-Clean Process – Appearance

**Figure 10-97 610D-10-071**

**Acceptable - Class 1, 2, 3**
- Flux residue on, around, or bridging between noncommon lands, component leads and conductors.
- Flux residue does not inhibit visual inspection.
- Flux residue does not inhibit access to test points of the assembly.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

**Figure 10-98 NEW**

**Figure 10-99 610D-10-072**

**Figure 10-100 NEW**

**Acceptable - Class 1**

**Process Indicator - Class 2**

**Defect - Class 3**

- Finger prints in no clean residue.

**Defect - Class 2,3**

- Flux residue inhibits visual inspection.
- Flux residue inhibits access to test points.
- Wet, tacky, or excessive flux residues that may spread onto other surfaces.
- No-clean flux residue on any electrical mating surface that inhibits electrical connection.

**Defect - Class 2,3**

- No-clean flux residue on any electrical mating surface that inhibits electrical connection.

**Note 1.** There is no defect for discoloration of OSP coated assemblies that come in contact with flux residues from no-clean process.

**Note 2.** Residue appearance may vary depending upon flux characteristics and solder processes.

**<MOVED UP ABOVE TO COMBINE DEFECTS**

**Acceptable – Class 1**

**Process Indicator – Class 2**

**Defect – Class 3**

- Finger prints in no clean residue.

**Defect – Class 1, 2, 3**

- Wet, tacky, or excessive flux residues that may spread onto other surfaces.
- No-clean flux residue on any electrical mating surface that inhibits electrical connection.

**10.6.5 10.4.5 Cleanliness - Surface Appearance**

**Figure 10-101 610D-10-073**

**Figure 10-102 610D-10-074**

**Figure 10-103 610D-10-075**

**Figure 10-104 610D-10-076**

**Figure 10-105 NEW**

**Acceptable - Class 1, 2, 3**

- Slight dulling of clean metallic surfaces.

**Defect - Class 1, 2, 3**

- Colored residues or rusty appearance on metallic surfaces or hardware.
- Evidence of corrosion.
10.7.10.5 Coatings

Coatings Acceptability Requirements

This section covers the acceptability requirements for conformal coatings and solder resist coatings on electronic assemblies. Additional information on solder resist is available in IPC-SM-840. Additional information on conformal coating is available in IPC-CC-830 and IPC-HDBK-830.

10.7.110.5.1 Solder ResistMask Coating

This section covers the acceptability requirements for solder mask coatings on electronic assemblies after assembly. Additional information on solder mask is available in IPC-SM-840

Solder ResistMask (MaskResist) A heat-resisting coating material applied to selected areas to prevent the deposition of solder upon those areas during subsequent soldering. Solder resistmask material may be applied as a liquid or a dry film. Both types meet the requirements of this guideline.

Although not rated for dielectric strength, and therefore not satisfying the definition of an "insulator or insulating material," some solder resistmask formulations provide limited insulation and are commonly used as surface insulation where high voltages are not a consideration.

In addition, solder resistmask is useful in preventing PWB-PCB surface damage during assembly operations.

Tape Test - The tape test referenced in this section is IPC-TM-650, Test Method 2.4.28.1. All loose and nonadhering material needs to be removed.

See IPC-A-600.

Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

10.7.21.2 10.5.1.2 Solder Resist Mask Coating — Voids, and Blisters, Scratches

During solder assembly operation, the resist mask prevents solder bridging. Blistering and loose particles of solder resist mask material are acceptable after the completion of the assembly provided they will not affect other functions in the assembly.

Defect - Class 1, 2, 3
- Solder resist mask particles cannot be completely removed and will affect the operation of the assembly.

Target - Class 1, 2, 3
- No blisters, scratches, voids or wrinkling evident under solder resist mask after soldering and cleaning operations.

Acceptable - Class 1, 2, 3
- Blisters, scratches, voids that do not expose conductors and do not bridge adjacent conductors, conductor surfaces or create a hazardous condition which would allow loose resist mask particles to become enmeshed in moving parts or lodged between two electrically conductive mating surfaces.
  Note: Blisters, scratches, voids that expose circuitry are acceptable as long as they don’t bridge adjacent circuitry.
- Solder flux, oil or cleaning agents are not trapped under blistered areas.

Process Indicator - Class 2,3
- Blisters/flaking expose base copper base conductor material.

Acceptable - Class 1
Defect - Class 2,3
- Coating blisters/scratches/voids allow film to flake in critical assemblies after a tape test.
- Solder fluxes, oils or cleaning agents are trapped under coating.

Defect - Class 1, 2, 3
- Coating blisters/scratches/voids bridge adjacent noncommon circuits.
- Loose particles of solder resist mask material that could affect form, fit or function.
- Coating blisters/scratches/voids have permitted solder bridges.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

**10.7.3.1 10.5.1.3 Solder Resist Mask Coating – Breakdown**

Figure 10-117 610D-10-087

Acceptable - Class 1, 2, 3
- Solder resist mask surfaces are homogeneous with no flaking or peeling over dielectric areas.

Defect - Class 1, 2, 3
- Solder resist mask has powdery whitish appearance with possible inclusions of solder metal.

**10.7.4 10.5.1.4 Solder Resist Mask Coating – Discoloration**

Figure 10-118 610D-10-088

Acceptable - Class 1, 2, 3
- Discoloration of the solder resist mask material.

Defect – Class 1, 2, 3
- Burned or charred solder mask material.
- Solder resist does not comply with 10.5.1.10 through 10.5.1.3.10.

**10.8 10.5.2 Conformal Coating**

This section covers the acceptability requirements for conformal coatings on electronic assemblies.

Additional information on conformal coating is available in IPC-CC-830 and IPC-HDBK-830.

**10.8.1 10.5.2.1 Conformal Coating – General**

Conformal coatings should be transparent, uniform in color and consistency and uniformly cover the board and components. Uniform coating distribution depends partly on the method of application and may affect visual appearance and corner coverage. Assemblies coated by dipping may have a drip line or localized build-up of the edge of the board. This build-up may contain a small amount of bubbles but it will not affect the functionality or reliability of the coating.

**10.8.2 10.5.2.2 Conformal Coating – Coverage**

The assembly may be examined with the unaided eye, see 1.9. Materials that contain a fluorescent pigment may be examined with blacklight to verify coverage. White light may be used as an aid for examining coverage.

**Figure 10-119 610D-10-089**

Target - Class 1, 2, 3
- No loss of adhesion.
- No voids or bubbles.
- No dewetting, mealing, peeling, wrinkles (nonadhering areas), cracks, ripples, fisheyes or orange peel.
- No embedded/entrapped foreign material.
- No discoloration or loss of transparency.
- Completely cured and uniform.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

Acceptable - Class 1, 2, 3
- Completely cured and homogenous.
- Coating only in those areas where coating is required.
- Loss of adhesion adjacent to masking.
- Voids do not bridge adjacent lands or conductive surfaces from:
  - loss of adhesion (mealing)
  - voids or bubbles
  - dewetting
  - cracks
  - ripples
  - fisheyes or
  - orange peel
  - flaking
- Foreign Entrapped material does not violate minimum electrical clearance between components, lands or conductive surfaces.
- Coating is thin but still coats component/device edges.

Defect - Class 1, 2, 3
- Coating is not cured (exhibits tackiness).
- Coating is not applied to required areas.
- Coating is on areas required to be free of coating, e.g., mating surfaces, adjustable hardware, wicking into connector housings, etc.
- Voids bridging of adjacent lands or conductive surfaces caused by:
  - loss of adhesion (mealing) (Figures 10-108, 113)
  - voids or bubbles (not shown)
  - dewetting (Figure 10-109)
  - cracks (not shown)
  - ripples (not shown)
  - fisheyes or (Figure 10-112)
  - orange peel (not shown)
  - flaking (Figure 10-114)
- Any entrapped foreign material that bridges lands or adjacent conductive surfaces, exposes circuitry or violates minimum electrical clearance between components, lands or conductive surfaces.
- Discoloration or loss of transparency.
- Coating wicking into connector housing.
- Coating wicking onto mating surfaces.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

**10.8.3 10.5.2.3 Conformal Coating – Thickness**

Table 10-1 provides coating thickness requirements. The thickness is to be measured on a flat, unencumbered, cured surface of the printed circuit assembly or a coupon that has been processed with the assembly. Coupons may be of the same type of material as the printed board or may be of a non-porous material such as metal or glass. As an alternative, a wet film thickness measurement may be used to establish the coating thickness provided there is documentation that correlates the wet and dry film thickness.

**Note:** Table 10-1 of this standard is to be used for printed circuit assemblies. The coating thickness requirements in IPC-CC-830 are to be used only for test vehicles associated with coating material testing and qualification.

### Table 10-1 Coating Thickness

<table>
<thead>
<tr>
<th>Type</th>
<th>Resin Type</th>
<th>Thickness Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type AR</td>
<td>Acrylic Resin</td>
<td>0.03-0.13 mm [0.00118-0.00512 in]</td>
</tr>
<tr>
<td>Type ER</td>
<td>Epoxy Resin</td>
<td>0.03-0.13 mm [0.00118-0.00512 in]</td>
</tr>
<tr>
<td>Type UR</td>
<td>Urethane Resin</td>
<td>0.03-0.13 mm [0.00118-0.00512 in]</td>
</tr>
<tr>
<td>Type SR</td>
<td>Silicone Resin</td>
<td>0.05-0.21 mm [0.00197-0.00827 in]</td>

<tr>
<td>Type XY</td>
<td>Paraxylene Resin</td>
<td>0.01-0.05 mm [0.00039-0.00197 in]</td>
</tr>
</tbody>
</table>

**Figure 10-125 610D-10-097**

**Acceptable - Class 1, 2, 3**
- Coating meets the thickness requirements of Table 10-1.

**Defect - Class 1, 2, 3**
- Coating does not meet thickness requirements of Table 10-1.
### 10.9 – Encapsulation

There are no illustrations for the encapsulation section.

**Acceptable - Class 1, 2, 3**
- Encapsulation material extends over and surrounds all areas required to be encapsulated.
- Encapsulation material is not present in areas not designated to be encapsulated.
- Completely cured and uniform.
- The encapsulant is free of bubbles, blisters, or breaks that affect the printed circuit assembly operation or sealing properties of the encapsulant material.
- No visible cracks, crazing, mealing, peeling, and/or wrinkles in the encapsulant material.
- Entrapped foreign material does not violate minimum electrical clearance between components, lands or conductive surfaces.
- Potting material has hardened and is tack free to the touch after curing.

**Note:** Minor surface swirls, striations or flow marks are not considered defects.

**Defect - Class 1, 2, 3**
- Encapsulation material missing from areas required to be encapsulated.
- Encapsulation material is present in areas not designated to be encapsulated or that that interferes with the electrical or physical function of the assembly.
- Encapsulation material is not cured (exhibits tackiness).
- Bubbles, blisters, or breaks that affect the printed circuit assembly operation or sealing properties of the encapsulant material.
- Visible cracks, crazing, mealing, peeling, and/or wrinkles in the encapsulant material.
- Any entrapped material that bridges lands or adjacent conductive surfaces, exposes circuitry or violates minimum electrical clearance between components, lands or conductive surfaces.
- Discoloration or loss of transparency.
11 Discrete Wiring

Discrete wiring refers to a substrate or base upon which discrete wiring techniques are used to obtain electronic interconnections. Separate visual criteria for each type are depicted in this section.

Discrete Wiring Acceptability Guidelines

The routing and terminating of discrete wires to form point-to-point electrical connections by use of special machines or tools may be employed to replace or supplement printed conductors on board assemblies. Application may be in planar, two-dimensional or three-dimensional configurations.

1. Semi-Permanent Connections
2. Permanent Connections

In addition to the criteria in this section the criteria of Section 5 are applicable.

The following topics are addressed in this section:

11.1 Solderless Wrap
11.1.1 Number of Turns
11.1.2 Turn Spacing
11.1.3 End Tails, Insulation Wrap
11.1.4 Raised Turns Overlap
11.1.5 Connection Position
11.1.6 Wire Dress
11.1.7 Wire Slack
11.1.8 Wire Plating
11.1.9 Damaged Insulation
11.1.10 Damaged Conductors & Terminals

11.2 Jumper Wires
11.2.5 Jumper Wires—SMT

11.2 Component Mounting – Connector Wire Dress Strain/Stress Relief
This section establishes visual acceptability criteria for connections made by the solderless wrap method.

It is assumed that the terminal/wire combination has been designed for this type of connection.

The tightness of the wire wrap should be validated by the tool verification process.

It is also assumed that a monitoring system exists that uses test connections to verify that the operator/tooling combination is capable of producing wraps that meet strip force requirements.

Depending on the service environment, the connecting instructions will specify whether the connection will be conventional or modified.

Once applied to the terminal, an acceptable solderless wrap connection shall not be subjected to excessive heat nor have any mechanical operations performed on it.

It is not acceptable to attempt to correct a defective connection by reapplying the wrapping tool or by applying other tools.

The reliability and maintainability advantages of the solderless wrap connection method are such that no repair of a defective wrap by soldering is to be made. Defective connections are unwrapped using a special tool (not stripped off the terminal) and then a new wire wrapped to the terminal. New wire shall used for each wrap/rewrap, but the terminal may be rewrapped many times.

### 11.1.1 Solderless Wrap - Number of Turns

For this requirement, countable turns are those turns of bare wire in intimate contact with the corners of the terminal starting at the first contact of bare wire with a terminal corner and ending at the last contact of bare wire with a terminal corner; see Table 11-1.

A modified wrap is required for Class 3. It has an additional amount of insulated wire wrapped to contact at least three corners of the terminal.

**Target - Class 1, 2, 3**
- One half (50%) more turn than the minimum shown in Table 11-1.

**Acceptable - Class 1, 2**
- Countable turns meet the requirements of Table 11-1.

**Acceptable - Class 3**
- Countable turns meet the requirements of Table 11-1.
- Meets requirements of modified wrap.

<table>
<thead>
<tr>
<th>Wire Gauge</th>
<th>Turns</th>
</tr>
</thead>
<tbody>
<tr>
<td>30</td>

<td>4</td>
</tr>
</tbody>
</table>

**Figure 11-1 610D-11-001**
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

**Note:** Maximum turns of bare and insulated wire is governed only by tooling configuration and space available on the terminal.

**Defect – Class 1, 2, 3**
- Number of countable turns does not comply with Table 11-1.

**Defect – Class 3**
- Does not meet requirements of modified wrap.

### 11.1.2 Solderless Wrap - Turn Spacing

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
11.1.3 Solderless Wrap - End Tails, Insulation Wrap

**Figure 11-5 610D-11-005**

**Target - Class 1,2**
- End tail does not *extend* beyond outer surface of wrap.
- Insulation reaches terminal.

**Target - Class 3**
- End tail does not *extend* beyond outer surface of wrap with insulation modified wrap (see 11.1.1).

**Figure 11-6 610D-11-006**

**Acceptable - Class 1**
- Does not violate minimum electrical clearance.
- Exposed conductor in the insulation.

**Acceptable - Class 2**
- Insulation end meets clearance requirements to other circuitry.
- End tail does not extend more than 3 mm [0.12 in] from outer surface of wrap.

**Acceptable - Class 3**
- End tail projects no more than one wire diameter from outer surface of wrap.
- Insulation must contact minimum of three corners of post.

**Figure 11-7 610D-11-007**

**Acceptable - Class 1**

**Defect - Class 2,3**
- End tail is greater than 3 mm [0.12 in].

**Defect - Class 3**
- End tail is greater than one wire diameter.

**Figure 11-8 610D-11-008**

**Defect - Class 1,2,3**
- End tail violates minimum electrical clearance.
11.1.4 Solderless Wrap - Raised Turns Overlap

Raised turns are squeezed out of the helix, therefore no longer have intimate contact with the terminal corners. Raised turns may overlap or override other turns.

**Figure 11-9 610D-11-009**

**Target - Class 1, 2, 3**
- No raised turns.

**Figure 11-10 610D-11-010**

**Acceptable - Class 1**
- Raised turns anywhere provided remaining total turns still have contact and meet minimum turns requirement.

**Acceptable - Class 2**
- No more than half turn raised within countable turns, any amount elsewhere.

**Acceptable - Class 3**
- No raised turns within countable turns, any amount elsewhere.

**Figure 11-11 610D-11-011**

**Defect - Class 1**
- Remaining total turns that still have contact do not meet minimum turn requirements.

**Defect - Class 2**
- More than half raised turn within countable turns.

**Defect - Class 3**
- Any raised turns within countable turns.

11.1.5 Solderless Wrap - Connection Position

**Figure 11-12 610D-11-012**

**Target - Class 1, 2, 3**
- All turns of each connection on working length of terminal.
- Visible separation between each connection.

**Figure 11-13 610D-11-013**

**Acceptable - Class 1,2**
- Extra turns of bare wire or any turns of insulated wire (whether or not for modified wrap) beyond end of working length of terminal.

**Acceptable - Class 1**
- Extra turns of bare wire or any turns of insulated wire overlap a preceding wrap.

**Acceptable - Class 2**
- Turns of insulated wire only overlap a preceding wrap.
Acceptable - Class 3
- Wraps may have an insulated wire overlap the last turn of uninsulated wire.
- No turns of bare or insulated wire beyond either end of working length.

Defect - Class 1,2,3
- Insufficient number of countable turns in contact with the terminal.
- Wire overlaps the wire turns of a preceding connection.

11.1.6 Solderless Wrap - Wire Dress

Acceptable - Class 1,2,3
- The dress of wire needs to be oriented so that force exerted axially on the wire will not tend to unwrap the connection, or to relieve the bite of wire on the corners of the terminal post. This requirement is satisfied when the wire is routed so as to cross the 45° line as shown.

Defect - Class 1,2,3
- Axially exerted external forces on the wrap will cause the wrap to unwind or loosen the wire bite at the post corners.

11.1.7 Solderless Wrap - Wire Slack

Acceptable - Class 1,2,3
- Wiring needs to have sufficient slack so that it will not pull around corners of the other terminal posts or bridge and load other wires.

Defect – Class 1,2,3
- Insufficient wire slack causing:
  - Abrasion between wire insulation and wrap post.
  - Tension on wires between wrap post causing distortion of posts.
  - Pressure on wires that are crossed by a taut wire.
Changes from Revision D to Revision E; references in the figure boxes refer to the source picture or indicate if a new picture is being used.

### 11.1.8 Solderless Wrap – Wire Plating

**Plating**
Wire used for solderless wrap is normally plated to improve connection reliability and minimize subsequent corrosion.

**Figure 11-20 610D-11-020**

<table>
<thead>
<tr>
<th>Target - Class 1, 2, 3</th>

<tr>
<td>Spacing requirements are violated.</td>
</tr>
</tbody>
</table>
11.1.10 Solderless Wrap - Damaged Conductors & Terminals

Target – Class 1,2,3
- Wire finish is not burnished or polished, nicked, scraped, gouged or otherwise damaged.
- Wire wrap terminals are not burnished, scraped or otherwise damaged.

Acceptable - Class 1,2,3
- Finish on the wire is burnished or polished (slight tool marks) (A).
- The top or last turn damaged from the wrap tool such as nicks, scrapes, gouges, etc., not exceeding 25% of wire diameter (B).
- Damage to terminal caused by tool such as burnishing, scraping, etc. (C)

Acceptable - Class 1,2
Defect - Class 3
- Base metal is exposed on terminal.

11.2 Jumper Wires

11.2.5 Jumper Wires – SMT

11.3 Component Mounting – Connector Wire Dress Strain/Stress Relief

Wires connecting to multi-contact connectors have slack adjusted to preclude stress of individual wires.

Acceptable - Class 1,2,3
- Wires exiting connector are positioned as they would be at installation.
- All wires are dressed with even bends to prevent stress at contact connections.
- Shortest wires are in direct line with center axis of cable.

Defect - Class 1
- Wires are separated from the connector.

Defect - Class 2,3
- Slack is inadequate to prevent stress of individual wires.
This chapter was greatly condensed but there are no changes in criteria.

12 High Voltage

This section provides the unique criteria for soldered connections that are subject to high voltages, see 1.5.4. These criteria are applicable to wires or leads attached to terminals, bare terminals, and through-hole connections. The requirements are to assure that there are no sharp edges or sharp points that could initiate arcing.

**Figure 12-1 New**

**Target - Class 1, 2, 3**
- Ball solder connection has a completely rounded, continuous and smooth profile.
- No evidence of sharp edges, solder points, icicles, inclusions (foreign material) or wire strands.
- Insulation clearance as close to the solder connection as possible without being embedded.
- All edges of the terminal are completely covered with a continuous smooth layer of solder forming a solder ball.
- Ball solder connection does not exceed specified height requirements.
- Insulation clearance (C) is minimal so that insulation is close to the solder connection without interfering with formation of the required solder ball.

**Figure 12-2 New**

**Acceptable - Class 1, 2, 3**
- Solder connection has an egg-shaped, spherical or oval profile that follows the contour of terminal and wire wrap, Figure 12-1.
- All sharp edges of the component lead and terminals are completely covered with a continuous smooth rounded layer of solder forming a solder ball, Figures 12-1 and 12-2 (A).
- Solder connections may have evidence of some layering or reflow lines, see 5.2.8.
- No evidence of sharp edges, solder points, icicles, inclusions (foreign material) or wire strands.
- Wire/lead outline is discernible with a smooth flow of solder on wire/lead and terminal. Individual strands may be discernible, Figure 12-2 (B).
- Straight-through leads facilitate ball soldering, Figure 12-2 (C).
- All sharp edges of the terminal's radial split are completely covered with a continuous smooth layer of solder forming a ball solder connection.
- There is no evidence of burrs or frayed edges on the hardware.
- Insulation clearance (C) is less than one overall diameter (D) away from the solder connection, Figure 12-2 (D).
- No evidence of insulation damage (ragged, charred, melted edges or indentations).
- Ball solder connection does not exceed specified height requirements.

**Figure 12-3 New**
This chapter was greatly condensed but there are no changes in criteria.

**Defect - Class 1, 2, 3**

- Discernible sharp edges, solder points, icicles, or inclusions (foreign material), Figure 12-4 (A).
- Evidence of edges not smooth and round with nicks or crevices.
- Solder follows contour of terminal and wire wrap but there is evidence of the sharp edge of the terminal protruding, Figure 12-4 (B).
- Evidence of wire strands not completely covered or discernible in the solder connection.
- Terminal lug is void of solder, Figure 12-4 (C).
- Hardware has burrs or frayed edges, Figure 12-4 (D).
- Insulation clearance (C) is one overall diameter (D) or more, Figure 12-4 (E).
- Evidence of insulation damage (ragged, charred, melted edges or indentations).
- Balled solder connection does not comply with height or profile (shape) requirements.
