Flexible Metal-Clad Dielectrics for Use in Fabrication of Flexible Printed Boards

Developed by the Flexible Circuits Base Materials Subcommittee (D-13) of the Flexible Circuits Committee (D-10) of IPC

Supersedes:
IPC-4204A with Amendment 1 - October 2013
IPC-4204A - October 2011
IPC-4204 - May 2002

Users of this publication are encouraged to participate in the development of future revisions.

Flexible Metal-Clad Dielectrics for Use in Fabrication of Flexible Printed Boards

1 SCOPE
This standard establishes the classification system, the qualification and quality conformance requirements for flexible metal-clad dielectric materials to be used for the fabrication of flexible printed boards.

1.1 Classification System  The system described in 1.1.1 through 1.1.2.7 identifies flexible metal-clad dielectrics.

1.1.1 Nonspecific Designation  A nonspecific designation is intended for use by designers on master drawings to designate their material choice. At the end of this standard is a series of material specification sheets identified by specification sheet numbers. Each sheet outlines engineering and performance data for a flexible metal-clad dielectrics, indicating base material type, adhesive type and method of reinforcement.

Example of nonspecific designation:  
IPC-4204/1, where “1” refers to the specification sheet detailing copper-clad polyimide dielectric with acrylic adhesive. If further material specification details (such as dielectric, adhesive or copper thicknesses) are required, they should be highlighted in cross sectional views or notes on the master drawing.

1.1.2 Specific Designation  The specific designation should be in the form shown in the following example, and is intended for use on material purchase orders by fabricators (see 6.1). The specific designation should not be used by designers on master drawings to indicate their material selection, as the designation is lengthy and requires fabricator level knowledge in making the detailed selections.

NOTE: The alpha character “Z” replaces and is entirely equivalent to the alpha character “O” (ref: Table 1-5) in the original release (prior revision) of this IPC standard. This interchange of characters within the designation will help alleviate confusion from using both the alpha character “O” and the digit “0” from the original release of this IPC standard. Legacy designs that utilize a designation and material description from the original release of this IPC standard [alpha character “O” (from Table 1-5)] may continue to be used. Supplier material certifications will reflect the current IPC standard’s revision, and accordingly, the alpha character “Z” in the designation.

Example of specific designation:  
IPC-4204/1 – E1E2M2/2 CU-W7-1P/1P
Where:  
IPC-4204/1 – Nonspecific Designation (see 1.1.1) specifying copper-clad dielectric with acrylic adhesive
E – Base Dielectric Type Designation (see 1.1.2.1) specifying polyimide
1 – Reinforcement Method Designation (see 1.1.2.2) specifying non-reinforced
E – Reinforcement Type Designation (see 1.1.2.3) specifying non-reinforced film
2 – Base Dielectric Thickness Designation (see 1.1.2.4) specifying 50microns [0.002 in]
M – Adhesive Type Designation (see 1.1.2.5) specifying acrylic adhesive
2/2 – Adhesive Thickness Designation (see 1.1.2.6) specifying 50 micron both sides (Not used for adhesiveless product)
CU-W7-1P/1P – Metal Cladding Designation (see 1.1.2.7) specifying wrought rolled annealed copper, 35 microns both sides with no treatment
