Guidelines for Microsection Preparation

Developed by the Microsection Subcommittee (7-12) of the Testing Committee (7-10) of IPC

Users of this publication are encouraged to participate in the development of future revisions.

8 TROUBLESHOOT GUIDE ....................................... 26
Guidelines for Microsection Preparation

1 SCOPE
Microsection preparation is a process. These guidelines discuss the many variables and problems associated with the process from sample removal to micro-etch. The guidelines do not promote any one vendor’s process, but discuss the variables common to microsectioning.

The process variables and problems are organized so the reader can research a specific issue or overview the variables of a process area.

2 APPLICABLE DOCUMENTS

2.1 IPC1

IPC-2221 Generic Standard on Printed Board Design
IPC-2222 Sectional Design Standard for Rigid Organic Printed Boards
IPC-2223 Sectional Design Standard for Flexible Printed Boards
IPC-T-50 Terms and Definitions for Interconnecting and Packaging Electronic Circuits
IPC-TM-650 Test Methods Manual2
2.1.1 Microsectioning, Manual and Semi or Automatic
2.2.5 Dimensional Inspections Using Microsections

3 SAMPLE REMOVAL PROCESS

3.1 Sample Location

3.1.1 Coupon Test Strip Companies generally use a “home grown” or military conformance coupon for microsection inspection. IPC-2221 outlines the attributes a coupon test strip should exhibit based on the product type being built.

Benefits:
• Production parts are not lost due to microsection testing.
• The internal and external features are the same from panel to panel to facilitate Statistical Process Control (SPC) data collection.
• The strips may be used to screen product as required.
• The customer can correlate to your microsection results easier because you both sample in the same location on the same test design.

Drawbacks:
• Space is lost on the panel that could be used to build parts.
• The test strip may not be representative of the associated part.

3.1.2 Part The actual production parts are used for microsection inspection.

Benefits:
• Space is not wasted on the panel due to test strips.
• There are no paneling constraints that dictate where the test strip must be placed to preserve part correlation.
• There is less of an issue over how representative the test strip is to the associated part.
